This specification is protected by copyright laws and contains material proprietary to the Khronos Group, Inc. It or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos Group. You may use this specification for implementing the functionality therein, without altering or removing any trademark, copyright or other notice from the specification, but the receipt or possession of this specification does not convey any rights to reproduce, disclose, or distribute its contents, or to manufacture, use, or sell anything that it may describe, in whole or in part.

Khronos Group grants express permission to any current Promoter, Contributor or Adopter member of Khronos to copy and redistribute UNMODIFIED versions of this specification in any fashion, provided that NO CHARGE is made for the specification and the latest available update of the specification for any version of the API is used whenever possible. Such distributed specification may be re-formatted AS LONG AS the contents of the specification are not changed in any way. The specification may be incorporated into a product that is sold as long as such product includes significant independent work developed by the seller. A link to the current version of this specification on the Khronos Group web-site should be included whenever possible with specification distributions.

Khronos Group makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this specification, including, without limitation, any implied warranties of merchantability or fitness for a particular purpose or non-infringement of any intellectual property. Khronos Group makes no, and expressly disclaims any, warranties, express or implied, regarding the correctness, accuracy, completeness, timeliness, and reliability of the specification. Under no circumstances will the Khronos Group, or any of its Promoters, Contributors or Members or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

Khronos, DevU, StreamInput, glTF, WebGL, WebCL, COLLADA, OpenKODE, OpenVG, OpenVX, OpenSL ES and OpenMAX are trademarks of the Khronos Group Inc. ASTC is a trademark of ARM Holdings PLC, OpenCL is a trademark of Apple Inc. and OpenGL is a registered trademark and the OpenGL ES and OpenGL SC logos are trademarks of Silicon Graphics International used under license by Khronos. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.

Contents

1	Introduction	2
1.1	Abstract	2
1.2	Purpose	2
1.3	Scope of Specification	2
1.4	Normative References	2
1.5	Version/Change History	3
1.6	Deprecation	3
1.7	Requirements Language	3
1.8	Typographical Conventions	3
1.8.1	Naming Conventions	3
1.9	Glossary and Acronyms	4
1.10	Acknowledgements	4
2	Design Overview	6
2.1	Software Landscape	6
2.2	Design Objectives	6
2.2.1	Hardware Optimizations	7
2.2.2	Hardware Limitations	7
2.3	Assumptions	7
2.3.1	Portability	7
2.3.2	Opacity	7
2.4	Object-Oriented Behaviors	7
2.5	OpenVX Framework Objects	7
2.6	OpenVX Data Objects	8
2.7	Error Objects	9
2.8	Graphs Concepts	9
2.8.1	Linking Nodes	9
2.8.2	Virtual Data Objects	9
2.8.3	Node Parameters	10
2.8.4	Graph Parameters	10
2.8.5	Execution Model	10
	Asynchronous Mode	11
2.8.6	Graph Formalisms	11
	Contained & Overlapping Data Objects	12
2.8.7	Node Execution Independence	13
2.8.8	Verification	15
2.9	Callbacks	15
2.10	User Kernels	15
2.10.1	Parameter Validation	16
	The Meta Format Object	16
2.10.2	User Kernels Naming Conventions	17
2.11	Targets	17
2.12	Base Vision Functions	17
2.12.1	Inputs	17
2.12.2	Outputs	18
2.13	Lifecycles	19
2.13.1	OpenVX Context Lifecycle	19

2.13.2	Graph Lifecycle	19
2.13.3	Data Object Lifecycle	20
	OpenVX Image Lifecycle	20
2.14	Host Memory Data Object Access Patterns	21
2.14.1	Matrix Access Example	21
2.14.2	Image Access Example	22
2.14.3	Array Access Example	23
2.15	Concurrent Data Object Access	23
2.16	Valid Image Region	23
2.17	Extending OpenVX	25
2.17.1	Extending Attributes	25
2.17.2	Vendor Custom Kernels	25
2.17.3	Vendor Custom Extensions	25
2.17.4	Hinting	25
2.17.5	Directives	26
2.18	Import and Export Framework	26
2.18.1	Import and Export of Objects	26
2.18.2	Creation of Objects Upon Import	26
2.18.3	Import and Export of Data Values For Objects To Be Created By The Framework	26
2.18.4	Import and Export of Values For Objects To Be Created By The Application	27
2.18.5	Import and Export of Meta Data	27
2.18.6	Restrictions Upon What References May Be Exported	27
2.18.7	Access To Object References In The Imported Object	27
2.19	Safety-critical Features	28
2.19.1	The Development and Deployment Feature Sets	28
2.19.2	Node creation APIs	28
2.19.3	Basic and Administrative Features APIs	28
2.19.4	Attributes	31
3	Module Documentation	32
3.1	Vision Functions	32
3.1.1	Detailed Description	32
3.2	Absolute Difference	35
3.2.1	Detailed Description	35
3.2.2	Function Documentation	35
	vxAbsDiffNode()	35
3.3	Accumulate	36
3.3.1	Detailed Description	36
3.3.2	Function Documentation	36
	vxAccumulateImageNode()	36
3.4	Accumulate Squared	37
3.4.1	Detailed Description	37
3.4.2	Function Documentation	37
	vxAccumulateSquareImageNode()	37
3.5	Accumulate Weighted	38
3.5.1	Detailed Description	38
3.5.2	Function Documentation	38
	vxAccumulateWeightedImageNode()	38
3.6	Arithmetic Addition	39
3.6.1	Detailed Description	39
3.6.2	Function Documentation	39
	vxAddNode()	39
3.7	Arithmetic Subtraction	40
3.7.1	Detailed Description	40
3.7.2	Function Documentation	40
	vxSubtractNode()	40
3.8	Bitwise AND	41
3.8.1	Detailed Description	41

3.8.2	Function Documentation	41
	vxAndNode()	41
3.9	Bitwise EXCLUSIVE OR	42
3.9.1	Detailed Description	42
3.9.2	Function Documentation	42
	vxXorNode()	42
3.10	Bitwise INCLUSIVE OR	43
3.10.1	Detailed Description	43
3.10.2	Function Documentation	43
	vxOrNode()	43
3.11	Bitwise NOT	44
3.11.1	Detailed Description	44
3.11.2	Function Documentation	44
	vxNotNode()	44
3.12	Box Filter	45
3.12.1	Detailed Description	45
3.12.2	Function Documentation	45
	vxBox3x3Node()	45
3.13	Canny Edge Detector	46
3.13.1	Detailed Description	46
3.13.2	Function Documentation	47
	vxCannyEdgeDetectorNode()	47
3.14	Channel Combine	48
3.14.1	Detailed Description	48
3.14.2	Function Documentation	48
	vxChannelCombineNode()	48
3.15	Channel Extract	49
3.15.1	Detailed Description	49
3.15.2	Function Documentation	49
	vxChannelExtractNode()	49
3.16	Color Convert	50
3.16.1	Detailed Description	50
3.16.2	Function Documentation	52
	vxColorConvertNode()	52
3.17	Convert Bit depth	53
3.17.1	Detailed Description	53
3.17.2	Function Documentation	53
	vxConvertDepthNode()	53
3.18	Custom Convolution	55
3.18.1	Detailed Description	55
3.18.2	Function Documentation	55
	vxConvolveNode()	55
3.19	Dilate Image	57
3.19.1	Detailed Description	57
3.19.2	Function Documentation	57
	vxDilate3x3Node()	57
3.20	Equalize Histogram	58
3.20.1	Detailed Description	58
3.20.2	Function Documentation	58
	vxEqualizeHistNode()	58
3.21	Erode Image	59
3.21.1	Detailed Description	59
3.21.2	Function Documentation	59
	vxErode3x3Node()	59
3.22	Fast Corners	60
3.22.1	Detailed Description	60
3.22.2	Segment Test Detector	60
3.22.3	Function Documentation	61

vxFastCornersNode()	61
3.23 Gaussian Filter	62
3.23.1 Detailed Description	62
3.23.2 Function Documentation	62
vxGaussian3x3Node()	62
3.24 Non Linear Filter	63
3.24.1 Detailed Description	63
3.24.2 Function Documentation	63
vxNonLinearFilterNode()	63
3.25 Harris Corners	64
3.25.1 Detailed Description	64
3.25.2 Function Documentation	65
vxHarrisCornersNode()	65
3.26 Histogram	67
3.26.1 Detailed Description	67
3.26.2 Function Documentation	67
vxHistogramNode()	67
3.27 Gaussian Image Pyramid	68
3.27.1 Detailed Description	68
3.27.2 Function Documentation	68
vxGaussianPyramidNode()	68
3.28 Laplacian Image Pyramid	69
3.28.1 Detailed Description	69
3.28.2 Function Documentation	69
vxLaplacianPyramidNode()	69
3.29 Reconstruction from a Laplacian Image Pyramid	70
3.29.1 Detailed Description	70
3.29.2 Function Documentation	70
vxLaplacianReconstructNode()	70
3.30 Integral Image	71
3.30.1 Detailed Description	71
3.30.2 Function Documentation	71
vxIntegralImageNode()	71
3.31 Magnitude	72
3.31.1 Detailed Description	72
3.31.2 Function Documentation	72
vxMagnitudeNode()	72
3.32 Mean and Standard Deviation	73
3.32.1 Detailed Description	73
3.32.2 Function Documentation	73
vxMeanStdDevNode()	73
3.33 Median Filter	74
3.33.1 Detailed Description	74
3.33.2 Function Documentation	74
vxMedian3x3Node()	74
3.34 Min, Max Location	75
3.34.1 Detailed Description	75
3.34.2 Function Documentation	75
vxMinMaxLocNode()	75
3.35 Optical Flow Pyramid (LK)	77
3.35.1 Detailed Description	77
3.35.2 Function Documentation	78
vxOpticalFlowPyrLKNode()	78
3.36 Phase	79
3.36.1 Detailed Description	79
3.36.2 Function Documentation	79
vxPhaseNode()	79
3.37 Pixel-wise Multiplication	80

3.37.1 Detailed Description	80
3.37.2 Function Documentation	80
vxMultiplyNode()	80
3.38 Remap	82
3.38.1 Detailed Description	82
3.38.2 Function Documentation	82
vxRemapNode()	82
3.39 Scale Image	83
3.39.1 Detailed Description	83
3.39.2 Function Documentation	84
vxScaleImageNode()	85
vxHalfScaleGaussianNode()	85
3.40 Sobel 3x3	87
3.40.1 Detailed Description	87
3.40.2 Function Documentation	87
vxSobel3x3Node()	87
3.41 TableLookup	88
3.41.1 Detailed Description	88
3.41.2 Function Documentation	88
vxTableLookupNode()	88
3.42 Thresholding	89
3.42.1 Detailed Description	89
3.42.2 Function Documentation	89
vxThresholdNode()	89
3.43 Warp Affine	90
3.43.1 Detailed Description	90
3.43.2 Function Documentation	90
vxWarpAffineNode()	90
3.44 Warp Perspective	92
3.44.1 Detailed Description	92
3.44.2 Function Documentation	92
vxWarpPerspectiveNode()	92
3.45 Basic Features	94
3.45.1 Detailed Description	94
3.45.2 Data Structure Documentation	95
struct vx_coordinates2d_t	95
struct vx_coordinates3d_t	95
struct vx_keypoint_t	96
struct vx_rectangle_t	96
3.45.3 Typedef Documentation	96
vx_enum	96
vx_status	96
3.45.4 Enumeration Type Documentation	96
vx_bool	97
3.45.5 Function Documentation	97
vxGetStatus()	97
3.46 Objects	98
3.46.1 Detailed Description	98
3.47 Object: Reference	99
3.47.1 Detailed Description	99
3.47.2 Macro Definition Documentation	99
VX_MAX_REFERENCE_NAME	99
3.47.3 Typedef Documentation	99
vx_reference	100
3.47.4 Function Documentation	100
vxQueryReference()	100
vxReleaseReference()	100
vxRetainReference()	101

	vxSetReferenceName()	101
3.48	Object: Context	103
3.48.1	Detailed Description	103
3.48.2	Typedef Documentation	103
	vx_context	104
3.48.3	Function Documentation	104
	vxCreateContext()	104
	vxReleaseContext()	104
	vxGetContext()	105
	vxQueryContext()	105
	vxSetContextAttribute()	105
3.49	Object: Graph	107
3.49.1	Detailed Description	107
3.49.2	Typedef Documentation	108
	vx_graph	108
3.49.3	Function Documentation	108
	vxCreateGraph()	108
	vxReleaseGraph()	108
	vxVerifyGraph()	109
	vxProcessGraph()	110
	vxScheduleGraph()	110
	vxWaitGraph()	111
	vxQueryGraph()	111
	vxSetGraphAttribute()	112
	vxIsGraphVerified()	112
	vxRegisterAutoAging()	112
3.50	Object: Node	114
3.50.1	Detailed Description	114
3.50.2	Typedef Documentation	114
	vx_node	114
3.50.3	Function Documentation	115
	vxQueryNode()	115
	vxSetNodeAttribute()	115
	vxReleaseNode()	116
	vxRemoveNode()	116
	vxSetNodeTarget()	117
	vxReplicateNode()	117
3.51	Object: Array	119
3.51.1	Detailed Description	119
3.51.2	Macro Definition Documentation	120
	vxFormatArrayPointer	120
	vxArrayItem	120
3.51.3	Function Documentation	120
	vxCreateArray()	120
	vxCreateVirtualArray()	121
	vxReleaseArray()	122
	vxQueryArray()	122
	vxAddArrayItems()	123
	vxTruncateArray()	123
	vxCopyArrayRange()	124
	vxMapArrayRange()	125
	vxUnmapArrayRange()	126
3.52	Object: Convolution	128
3.52.1	Detailed Description	128
3.52.2	Function Documentation	128
	vxCreateConvolution()	128
	vxReleaseConvolution()	129
	vxQueryConvolution()	129

	<code>vxSetConvolutionAttribute()</code>	130
	<code>vxCopyConvolutionCoefficients()</code>	130
3.53	Object: Distribution	132
3.53.1	Detailed Description	132
3.53.2	Function Documentation	132
	<code>vxCreateDistribution()</code>	132
	<code>vxReleaseDistribution()</code>	133
	<code>vxQueryDistribution()</code>	133
	<code>vxCopyDistribution()</code>	134
	<code>vxMapDistribution()</code>	135
	<code>vxUnmapDistribution()</code>	136
3.54	Object: Image	137
3.54.1	Detailed Description	137
3.54.2	Data Structure Documentation	138
	<code>struct vx_imagepatch_addressing_t</code>	138
	<code>union vx_pixel_value_t</code>	139
3.54.3	Typedef Documentation	139
	<code>vx_image</code>	139
3.54.4	Function Documentation	140
	<code>vxCreateImage()</code>	140
	<code>vxCreateImageFromROI()</code>	140
	<code>vxCreateUniformImage()</code>	141
	<code>vxCreateVirtualImage()</code>	141
	<code>vxCreateImageFromHandle()</code>	142
	<code>vxSwapImageHandle()</code>	143
	<code>vxQueryImage()</code>	144
	<code>vxSetImageAttribute()</code>	144
	<code>vxReleaseImage()</code>	145
	<code>vxComputeImagePatchSize()</code>	146
	<code>vxFormatImagePatchAddress1d()</code>	146
	<code>vxFormatImagePatchAddress2d()</code>	146
	<code>vxGetValidRegionImage()</code>	147
	<code>vxCopyImagePatch()</code>	147
	<code>vxMapImagePatch()</code>	148
	<code>vxUnmapImagePatch()</code>	150
	<code>vxCreateImageFromChannel()</code>	151
	<code>vxSetImageValidRectangle()</code>	151
3.55	Object: LUT	152
3.55.1	Detailed Description	152
3.55.2	Function Documentation	152
	<code>vxCreateLUT()</code>	152
	<code>vxReleaseLUT()</code>	153
	<code>vxQueryLUT()</code>	153
	<code>vxCopyLUT()</code>	154
	<code>vxMapLUT()</code>	155
	<code>vxUnmapLUT()</code>	156
3.56	Object: Matrix	157
3.56.1	Detailed Description	157
3.56.2	Function Documentation	157
	<code>vxCreateMatrix()</code>	157
	<code>vxReleaseMatrix()</code>	158
	<code>vxQueryMatrix()</code>	158
	<code>vxCopyMatrix()</code>	159
	<code>vxCreateMatrixFromPattern()</code>	159
3.57	Object: Pyramid	161
3.57.1	Detailed Description	161
3.57.2	Function Documentation	161
	<code>vxCreatePyramid()</code>	162

	<code>vxCreateVirtualPyramid()</code>	162
	<code>vxReleasePyramid()</code>	163
	<code>vxQueryPyramid()</code>	163
	<code>vxGetPyramidLevel()</code>	164
3.58	Object: Remap	165
3.58.1	Detailed Description	165
3.58.2	Function Documentation	165
	<code>vxCreateRemap()</code>	165
	<code>vxReleaseRemap()</code>	166
	<code>vxSetRemapPoint()</code>	166
	<code>vxGetRemapPoint()</code>	167
	<code>vxQueryRemap()</code>	167
3.59	Object: Scalar	169
3.59.1	Detailed Description	169
3.59.2	Typedef Documentation	169
	<code>vx_scalar</code>	169
3.59.3	Function Documentation	169
	<code>vxCreateScalar()</code>	169
	<code>vxReleaseScalar()</code>	170
	<code>vxQueryScalar()</code>	170
	<code>vxCopyScalar()</code>	171
3.60	Object: Threshold	172
3.60.1	Detailed Description	172
3.60.2	Function Documentation	172
	<code>vxCreateThreshold()</code>	172
	<code>vxReleaseThreshold()</code>	173
	<code>vxSetThresholdAttribute()</code>	173
	<code>vxQueryThreshold()</code>	173
3.61	Object: ObjectArray	175
3.61.1	Detailed Description	175
3.61.2	Function Documentation	175
	<code>vxCreateObjectArray()</code>	175
	<code>vxCreateVirtualObjectArray()</code>	176
	<code>vxGetObjectArrayItem()</code>	176
	<code>vxReleaseObjectArray()</code>	177
	<code>vxQueryObjectArray()</code>	177
3.62	Object: Import	178
3.62.1	Detailed Description	178
3.62.2	Macro Definition Documentation	178
	<code>VX_IX_USE_APPLICATION_CREATE</code>	179
	<code>VX_IX_USE_EXPORT_VALUES</code>	179
	<code>VX_IX_USE_NO_EXPORT_VALUES</code>	179
	<code>VX_TYPE_IMPORT</code>	179
3.62.3	Function Documentation	179
	<code>vxImportObjectsFromMemory()</code>	179
	<code>vxReleaseImport()</code>	181
	<code>vxGetImportReferenceByName()</code>	181
	<code>vxExportObjectsToMemory()</code>	182
	<code>vxReleaseExportedMemory()</code>	184
3.63	Administrative Features	186
3.63.1	Detailed Description	186
3.64	Advanced Objects	187
3.64.1	Detailed Description	187
3.65	Object: Array (Advanced)	188
3.65.1	Detailed Description	188
3.65.2	Function Documentation	188
	<code>vxRegisterUserStruct()</code>	188
3.66	Object: Node (Advanced)	189

3.66.1	Detailed Description	189
3.66.2	Function Documentation	189
	vxCreateGenericNode()	189
3.67	Node: Border Modes	190
3.67.1	Detailed Description	190
3.67.2	Data Structure Documentation	190
	struct vx_border_t	190
3.68	Object: Delay	191
3.68.1	Detailed Description	191
3.68.2	Typedef Documentation	191
	vx_delay	192
3.68.3	Function Documentation	192
	vxQueryDelay()	192
	vxReleaseDelay()	192
	vxCreateDelay()	193
	vxGetReferenceFromDelay()	194
	vxAgeDelay()	194
3.69	Object: Kernel	195
3.69.1	Detailed Description	195
3.69.2	Data Structure Documentation	196
	struct vx_kernel_info_t	196
3.69.3	Typedef Documentation	196
	vx_kernel	196
3.69.4	Function Documentation	196
	vxGetKernelByName()	196
	vxGetKernelByEnum()	198
	vxQueryKernel()	198
	vxReleaseKernel()	199
3.70	Object: Parameter	200
3.70.1	Detailed Description	200
3.70.2	Typedef Documentation	200
	vx_parameter	200
3.70.3	Function Documentation	201
	vxGetKernelParameterByIndex()	201
	vxGetParameterByIndex()	201
	vxReleaseParameter()	201
	vxSetParameterByIndex()	202
	vxSetParameterByReference()	202
	vxQueryParameter()	203
3.71	Advanced Framework API	204
3.71.1	Detailed Description	204
3.72	Framework: Node Callbacks	205
3.72.1	Detailed Description	205
3.72.2	Typedef Documentation	206
	vx_action	207
	vx_nodecomplete_f	207
3.72.3	Function Documentation	207
	vxAssignNodeCallback()	207
	vxRetrieveNodeCallback()	208
3.73	Framework: Performance Measurement	209
3.73.1	Detailed Description	209
3.73.2	Data Structure Documentation	209
	struct vx_perf_t	209
3.74	Framework: Log	210
3.74.1	Detailed Description	210
3.74.2	Function Documentation	210
	vxAddLogEntry()	210
	vxRegisterLogCallback()	211

3.75 Framework: Hints	212
3.75.1 Detailed Description	212
3.75.2 Function Documentation	212
vxHint()	212
3.76 Framework: Directives	213
3.76.1 Detailed Description	213
3.76.2 Function Documentation	213
vxDirective()	213
3.77 Framework: User Kernels	214
3.77.1 Detailed Description	214
3.77.2 Typedef Documentation	218
vx_meta_format	218
vx_publish_kernels_f	218
vx_unpublish_kernels_f	218
vx_kernel_f	219
vx_kernel_initialize_f	219
vx_kernel_deinitialize_f	219
vx_kernel_validate_f	219
vx_kernel_image_valid_rectangle_f	220
3.77.3 Function Documentation	221
vxAllocateUserKernelId()	221

Chapter 1

Introduction

1.1 Abstract

OpenVX is a low-level programming framework domain to enable software developers to efficiently access computer vision hardware acceleration with both functional and performance portability. OpenVX has been designed to support modern hardware architectures, such as mobile and embedded SoCs as well as desktop systems. Many of these systems are parallel and heterogeneous: containing multiple processor types including multi-core CPUs, DSP subsystems, GPUs, dedicated vision computing fabrics as well as hardwired functionality. Additionally, vision system memory hierarchies can often be complex, distributed, and not fully coherent. OpenVX is designed to maximize functional and performance portability across these diverse hardware platforms, providing a computer vision framework that efficiently addresses current and future hardware architectures with minimal impact on applications.

OpenVX contains:

- a library of predefined and customizable vision functions,
- a graph-based execution model to combine function enabling both task and data-independent execution, and;
- a set of memory objects that abstract the physical memory.

OpenVX defines a C Application Programming Interface (API) for building, verifying, and coordinating graph execution, as well as for accessing memory objects. The graph abstraction enables OpenVX implementers to optimize the execution of the graph for the underlying acceleration architecture.

Safety-critical implementations require rigorous demands for deployment (for example ISO26262). OpenVX SC defines a deployment feature set to enable safety-critical applications, which exposes a way to import pre-verified graphs and other objects. The OpenVX SC does not include *vxu* utility library because it is not practical to implement such a library for safety-critical environments.

As the computer vision domain is still rapidly evolving, OpenVX provides an extensibility mechanism to enable developer-defined functions to be added to the application graph.

1.2 Purpose

The purpose of this document is to detail the Application Programming Interface (API) for OpenVX.

1.3 Scope of Specification

The document contains the definition of the OpenVX API. The conformance tests that are used to determine whether an implementation is consistent to this specification are defined separately.

1.4 Normative References

The section “Module Documentation” forms the normative part of the specification. Each API definition provided in that chapter has certain preconditions and post conditions specified that are normative. If these normative conditions are not met, the behavior of the function is undefined.

1.5 Version/Change History

- OpenVX 1.0 Provisional - November, 2013
- OpenVX 1.0 Provisional V2 - June, 2014
- OpenVX 1.0 - September 2014
- OpenVX 1.0.1 - April 2015
- OpenVX 1.1 - May 2016

1.6 Deprecation

Certain items that are deprecated through the evolution of this specification document are removed from it. However, to provide a backward compatibility for such items for a certain time period these items are made available via a compatibility header file available with the release of this specification document (`vx_compatibility.h`). The items listed in this compatibility header file are temporary only and are removed permanently when the backward compatibility is no longer supported for those items.

1.7 Requirements Language

In this specification, the words *shall* or *must* express a requirement that is binding, *should* expresses design goals or recommended actions, and *may* expresses an allowed behavior.

1.8 Typographical Conventions

The following typographical conventions are used in this specification.

- **Bold** words indicate warnings or strongly communicated concepts that are intended to draw attention to the text.
- `Monospace` words signify an API element (i.e., class, function, structure) or a filename.
- *Italics* denote an emphasis on a particular concept, an abstraction of a concept, or signify an argument, parameter, or member.
- Throughout this specification, code examples given to highlight a particular issue use the format as shown below:
- ```
/* Example Code Section */
int main(int argc, char *argv[])
{
 return 0;
}
```
- Some “mscgen” message diagrams are included in this specification. The graphical conventions for this tool can be found on its website.

See also

<http://www.mcternan.me.uk/mscgen/>

### 1.8.1 Naming Conventions

The following naming conventions are used in this specification.

- Opaque objects and atomics are named as `vx_object`, e.g., `vx_image` or `vx_uint8`, with an underscore separating the object name from the “vx” prefix.
- Defined Structures are named as `vx_struct_t`, e.g., `vx_imagepatch_addressing_t`, with under-scores separating the structure from the “vx” prefix and a “t” to denote that it is a structure.

- Defined Enumerations are named as `vx_enum_e`, e.g., [The VX\\_TYPE Constants](#), with underscores separating the enumeration from the “vx” prefix and an “e” to denote that it is an enumerated value.
- Application Programming Interfaces are named `vxSomeFunction()` using camel case, starting with lower-case, and no underscores, e.g., `vxCreateContext()`.
- Vision functions also have a naming convention that follows a lower-case, inverse dotted hierarchy similar to Java Packages, e.g.,

```
"org.khronos.openvx.color_convert".
```

This minimizes the possibility of name collisions and promotes sorting and readability when querying the namespace of available vision functions. Each vision function should have a unique dotted name of the style: *tld.vendor.library.function*. The hierarchy of such vision function namespaces is undefined outside the subdomain “org.khronos”, but they do follow existing international standards. For OpenVX-specified vision functions, the “function” section of the unique name does not use camel case and uses underscores to separate words.

## 1.9 Glossary and Acronyms

- Atomic: The specification mentions *atomics*, which means a C primitive data type. Usages that have additional wording, such as *atomic operations* do not carry this meaning.
- API: Application Programming Interface that specifies how a software component interacts with another.
- Framework: A generic software abstraction in which users can override behaviors to produce application-specific functionality.
- Engine: A purpose-specific software abstraction that is tunable by users.
- Run-time: The execution phase of a program.
- Kernel: OpenVX uses the term *kernel* to mean an abstract *computer vision function*, not an Operating System kernel. Kernel may also refer to a set of convolution coefficients in some computer vision literature (e.g., the Sobel “kernel”). OpenVX does not use this meaning. OpenCL uses kernel (specifically `cl_kernel`) to qualify a function written in “CL” which the OpenCL may invoke directly. This is close to the meaning OpenVX uses; however, OpenVX does not define a language.

## Chapter 2

# Design Overview

### 2.1 Software Landscape

OpenVX is intended to be used either directly by applications or as the acceleration layer for higher-level vision frameworks, engines or platform APIs.

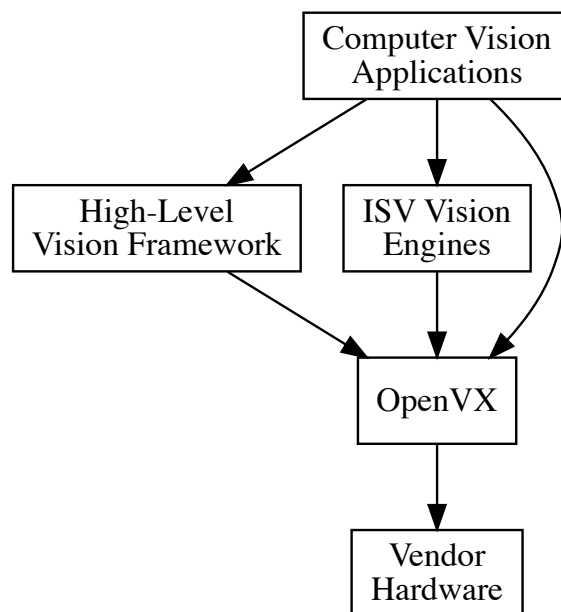

Figure 2.1: OpenVX Usage Overview

### 2.2 Design Objectives

OpenVX is designed as a framework of standardized computer vision functions able to run on a wide variety of platforms and potentially to be accelerated by a vendor's implementation on that platform. OpenVX can improve the

performance and efficiency of vision applications by providing an abstraction for commonly-used vision functions and an abstraction for aggregations of functions (a “graph”), thereby providing the implementer the opportunity to minimize the run-time overhead.

The functions in OpenVX are intended to cover common functionality required by many vision applications.

### 2.2.1 Hardware Optimizations

This specification makes no statements as to which acceleration methodology or techniques may be used in its implementation. Vendors may choose any number of implementation methods such as parallelism and/or specialized hardware offload techniques.

This specification also makes no statement or requirements on a “level of performance” as this may vary significantly across platforms and use cases.

### 2.2.2 Hardware Limitations

The OpenVX focuses on vision functions that can be significantly accelerated by diverse hardware. Future versions of this specification may adopt additional vision functions into the core standard when hardware acceleration for those functions becomes practical.

## 2.3 Assumptions

### 2.3.1 Portability

OpenVX has been designed to maximize functional and performance portability wherever possible, while recognizing that the API is intended to be used on a wide diversity of devices with specific constraints and properties. Tradeoffs are made for portability where possible: for example, portable Graphs constructed using this API should work on any OpenVX implementation and return similar results within the precision bounds defined by the OpenVX conformance tests.

### 2.3.2 Opaqueness

OpenVX is intended to address a very broad range of devices and platforms, from deeply embedded systems to desktop machines and distributed computing architectures. The OpenVX API addresses this range of possible implementations without forcing hardware-specific requirements onto any particular implementation via the use of *opaque* objects for most program data.

All data, except client-facing structures, are opaque and hidden behind a reference that may be as thin or thick as an implementation needs. Each implementation provides the standardized interfaces for accessing data that takes care of specialized hardware, platform, or allocation requirements. Memory that is *imported* or *shared* from other APIs is not subsumed by OpenVX and is still maintained and accessible by the originator.

OpenVX does not dictate any requirements on memory allocation methods or the layout of opaque memory objects and it does not dictate byte packing or alignment for structures on architectures.

## 2.4 Object-Oriented Behaviors

OpenVX objects are both strongly typed at compile-time for safety critical applications and are strongly typed at run-time for dynamic applications. Each object has its typedef'd type and its associated enumerated value in the [The VX\\_TYPE Constants](#) list. Any object may be down-cast to a [vx\\_reference](#) safely to be used in functions that require this, specifically [vxQueryReference](#), which can be used to get the [The VX\\_TYPE Constants](#) value using an [vx\\_enum](#).

## 2.5 OpenVX Framework Objects

This specification defines the following OpenVX framework objects.

- **Object: Context** - The OpenVX context is the object domain for all OpenVX objects. All data objects *live* in the context as well as all framework objects. The OpenVX context keeps reference counts on all objects and must

do garbage collection during its deconstruction to free lost references. While multiple clients may connect to the OpenVX context, all data are private in that the references that refer to data objects are given only to the creating party. The results of calling an OpenVX function on data objects created in different contexts are undefined.

- **Object: Kernel** - A Kernel in OpenVX is the abstract representation of a computer vision function, such as a “Sobel Gradient” or “Lucas Kanade Feature Tracking”. A vision function may implement many similar or identical features from other functions, but it is still considered a single, unique kernel as long as it is named by the same string and enumeration and conforms to the results specified by OpenVX. Kernels are similar to function signatures in this regard.
- **Object: Parameter** - An abstract input, output, or bidirectional data object passed to a computer vision function. This object contains the signature of that parameter’s usage from the kernel description. This information includes:
  - *Signature Index* - The numbered index of the parameter in the signature.
  - *Object Type* - e.g. `VX_TYPE_IMAGE`, or `VX_TYPE_ARRAY`, or some other object type from [The VX\\_TYPE Constants](#).
  - *Usage Model* - e.g. `VX_INPUT`, `VX_OUTPUT`, or `VX_BIDIRECTIONAL`.
  - *Presence State* - e.g. `VX_PARAMETER_STATE_REQUIRED`, or `VX_PARAMETER_STATE_OPTIONAL`.
- **Object: Node** - A node is an instance of a kernel that will be paired with a specific set of references (the parameters). Nodes are created from and associated with a single graph only. When a `vx_parameter` is extracted from a Node, an additional attribute can be accessed:
  - *Reference* - The `vx_reference` assigned to this parameter index from the Node creation function (e.g., `vxSobel3x3Node`).
- **Object: Graph** - A set of nodes connected in a directed (only goes one-way) acyclic (does not loop back) fashion. A Graph may have sets of Nodes that are unconnected to other sets of Nodes within the same Graph. See [Graph Formalisms](#).

## 2.6 OpenVX Data Objects

Data objects are object that are processed by graphs in nodes.

- **Object: Array** An opaque array object that could be an array of primitive data types or an array of structures.
- **Object: Convolution** An opaque object that contains  $M \times N$  matrix of `vx_int16` values. Also contains a scaling factor for normalization. Used specifically with `vxConvolveNode`.
- **Object: Delay** An opaque object that contains a manually controlled, temporally-delayed list of objects.
- **Object: Distribution** An opaque object that contains a frequency distribution (e.g., a histogram).
- **Object: Image** An opaque image object that may be some format in [Image Type Constants](#).
- **Object: LUT** An opaque lookup table object used with `vxTableLookupNode`.
- **Object: Matrix** An opaque object that contains  $M \times N$  matrix of some scalar values.
- **Object: Pyramid** An opaque object that contains multiple levels of scaled `vx_image` objects.
- **Object: Remap** An opaque object that contains the map of source points to destination points used to transform images.
- **Object: Scalar** An opaque object that contains a single primitive data type.
- **Object: Threshold** An opaque object that contains the thresholding configuration.
- **Object: ObjectArray** An opaque array object that could be an array of any data-object (not data-type) of OpenVX except Delay and ObjectArray objects.

## 2.7 Error Objects

Error objects are specialized objects that may be returned from other object creator functions when serious platform issue occur (i.e., out of memory or out of handles). These can be checked at the time of creation of these objects, but checking also may be put-off until usage in other APIs or verification time, in which case, the implementation must return appropriate errors to indicate that an invalid object type was used.

```
vx_object obj = vxCreateObject(context, ...);
vx_status status = vxGetStatus((vx_reference)obj);
if (status == VX_SUCCESS) {
 // object is good
}
```

## 2.8 Graphs Concepts

The *graph* is the central computation concept of OpenVX. The purpose of using graphs to express the Computer Vision problem is to allow for the possibility of any implementation to maximize its optimization potential because all the operations of the graph and its dependencies are known ahead of time, before the graph is processed.

Graphs are composed of one or more *nodes* that are added to the graph through node creation functions. Graphs in OpenVX must be created ahead of processing time and verified by the implementation, after which they can be processed as many times as needed.

### 2.8.1 Linking Nodes

Graph Nodes are linked together via data dependencies with *no explicitly-stated ordering*. The same reference may be linked to other nodes. Linking has a limitation, however, in that only one node in a graph may output to any specific data object reference. That is, only a single writer of an object may exist in a given graph. This prevents indeterminate ordering from data dependencies. All writers in a graph shall produce output data before any reader of that data accesses it.

### 2.8.2 Virtual Data Objects

Graphs in OpenVX depend on data objects to link together nodes. When clients of OpenVX know that they do not need access to these *intermediate* data objects, they may be created as *virtual*. Virtual data objects can be used in the same manner as non-virtual data objects to link nodes of a graph together; however, virtual data objects are different in the following respects.

- **Inaccessible** - No calls to an Map/Unmap or Copy APIs shall succeed given a reference to an object created through a virtual create function from a Graph external perspective. Calls to Map/Unmap or Copy APIs from within client-defined node that belongs to the same graph as the virtual object will succeed as they are Graph internal.
- **Scoped** - Virtual data objects are scoped within the Graph in which they are created; they cannot be shared outside their scope. The live range of the data content of a virtual data object is limited to a single graph execution. In other word, data content of a virtual object is undefined before graph execution and no data of a virtual object should be expected to be preserved across successive graph executions by the application.
- **Intermediates** - Virtual data objects should be used only for intermediate operations within Graphs, because they are fundamentally inaccessible to clients of the API.
- **Dimensionless or Formatless** - Virtual data objects may have dimensions and formats partially or fully undefined at creation time. For instance, a virtual image can be created with undefined or partially defined dimensions (0x0, Nx0 or 0xN where N is not null) and/or without defined format (VX\_DF\_IMAGE\_VIRT). The undefined property of the virtual object at creation time is undefined with regard to the graph and mutable at graph verification time; it will be automatically adjusted at each graph verification, deduced from the node that outputs the virtual object. Dimensions and format properties that are well defined at virtual object creation time are immutable and can't be adjusted automatically at graph verification time. The Dimensionless or Formatless aspect of virtual data is a commodity that allows creating graphs generic with regard to dimensions or format, but there are restrictions:

1. Nodes may require the dimensions and/or the format to be defined for a virtual output object when it can't be deduced from its other parameters. For example, a Scale node requires well defined dimensions for the output image, while ColorConvert and ChannelCombine nodes require a well defined format for the output image.
  2. An image created from ROI must always be well defined (`vx_rectangle_t` parameter) and can't be created from a dimensionless virtual image.
  3. A ROI of a formatless virtual image shouldn't be a node output.
  4. Levels of a dimensionless or formatless virtual pyramid shouldn't be a node output.
- Inheritance - A sub-object inherits from the virtual property of its parent. A sub-object also inherits from the Dimensionless or Formatless property of its parent with restrictions:
    1. it is adjusted automatically at graph verification when the parent properties are adjusted (the parent is the output of a node)
    2. it can't be adjusted at graph verification when the sub-object is itself the output of a node.
  - Optimizations - Virtual data objects do not have to be created during Graph validation and execution and therefore may be of zero size.

These restrictions enable vendors the ability to optimize some aspects of the data object or its usage. Some vendors may not allocate such objects, some may create intermediate sub-objects of the object, and some may allocate the object on remote, inaccessible memories. OpenVX does not proscribe *which* optimization the vendor does, merely that it *may* happen.

### 2.8.3 Node Parameters

Parameters to node creation functions are defined as either atomic types, such as `vx_int32`, `vx_enum`, or as objects, such as `vx_scalar`, `vx_image`. The atomic variables of the Node creation functions shall be converted by the framework into `vx_scalar` references for use by the Nodes. A node parameter of type `vx_scalar` can be changed during the graph execution; whereas, a node parameter of an atomic type (`vx_int32` etc.) require at least a graph revalidation if changed. All node parameter objects may be modified by retrieving the reference to the `vx_parameter` via `vxGetParameterByIndex`, and then passing that to `vxQueryParameter` to retrieve the reference to the object.

```
vx_parameter param = vxGetParameterByIndex(node, p);
vx_reference ref;
vxQueryParameter(param, VX_PARAMETER_REF, &ref, sizeof(ref));
```

If the type of the parameter is unknown, it may be retrieved with the same function.

```
vx_enum type;
vxQueryParameter(param, VX_PARAMETER_TYPE, &type, sizeof(type)
);
/* cast the ref to the correct vx_<type>. Atomics are now vx_scalar */
```

### 2.8.4 Graph Parameters

Parameters may exist on Graphs, as well. These parameters are defined by the author of the Graph and each Graph parameter is defined as a specific parameter from a Node within the Graph using `vxAddParameterToGraph`. Graph parameters communicate to the implementation that there are specific Node parameters that may be modified by the client between Graph executions. Additionally, they are parameters that the client may set without the reference to the Node but with the reference to the Graph using `vxSetGraphParameterByIndex`. This allows for the Graph authors to construct *Graph Factories*. How these factories work falls outside the scope of this document.

See also

[Framework: Graph Parameters](#)

### 2.8.5 Execution Model

Graphs must execute in both:

- *Synchronous blocking mode* (in that `vxProcessGraph` will block until the graph has completed), and in
- *Asynchronous single-issue-per-reference mode* (via `vxScheduleGraph` and `vxWaitGraph`).

### Asynchronous Mode

In asynchronous mode, Graphs must be single-issue-per-reference. This means that given a constructed graph reference  $G$ , it may be scheduled multiple times but only executes sequentially with respect to itself. Multiple graphs references given to the asynchronous graph interface do not have a defined behavior and may execute in parallel or in series based on the behavior or the vendor's implementation.

## 2.8.6 Graph Formalisms

To use graphs several rules must be put in place to allow deterministic execution of Graphs. The behavior of a `processGraph( G )` call is determined by the structure of the Processing Graph  $G$ . The Processing Graph is a bipartite graph consisting of a set of Nodes  $N_1 \dots N_n$  and a set of data objects  $d_1 \dots d_i$ . Each edge  $( N_x, D_y )$  in the graph represents a data object  $D_y$  that is written by Node  $N_x$  and each edge  $( D_x, N_y )$  represents a data object  $D_x$  that is read by Node  $N_y$ . Each edge  $e$  has a name  $\text{Name}( e )$ , which gives the parameter name of the node that references the corresponding data object. Each Node Parameter also has a type  $\text{Type}( \text{node}, \text{name} )$  in  $\{ \text{IN} \leftrightarrow \text{PUT}, \text{OUTPUT}, \text{INOUT} \}$ . Some data objects are *Virtual*, and some data objects are *Delay*. Delay data objects are just collections of data objects with indexing (like an image list) and known linking points in a graph. A node may be classified as a *head node*, which has no backward dependency. Alternatively, a node may be a *dependent node*, which has a backward dependency to the head node. In addition, the Processing Graph has several restrictions:

1. *Output typing* - Every output edge  $( N_x, D_y )$  requires  $\text{Type}( N_x, \text{Name}( N_x, D_y ) )$  in  $\{ \text{OUTPUT}, \text{INOUT} \}$
2. *Input typing* - Every input edge  $( N_x, D_y )$  requires  $\text{Type}( N_y, \text{Name}( D_x, N_y ) )$  in  $\{ \text{INPUT} \}$  or  $\{ \text{INOUT} \}$
3. *Single Writer* - Every data object is the target of at most one output edge.
4. *Broken Cycles* - Every cycle in  $G$  must contain at least input edge  $( D_x, N_y )$  where  $D_x$  is Delay.
5. *Virtual images must have a source* - If  $D_y$  is Virtual, then there is at least one output edge that writes  $D_y$   $( N_x, D_y )$
6. *Bidirectional data objects shall not be virtual* - If  $\text{Type}( N_x, \text{Name}( N_x, D_y ) )$  is INOUT implies  $D_y$  is non-Virtual.
7. *Delay data objects shall not be virtual* - If  $D_x$  is Delay then it shall not be Virtual.
8. *A uniform image cannot be output or bidirectional.*

The execution of each node in a graph consists of an atomic operation (sometimes referred to as *firing*) that consumes data representing each input data object, processes it, and produces data representing each output data object. A node may execute when all of its input edges are marked *present*. Before the graph executes, the following initial marking is used:

- All input edges  $( D_x, N_y )$  from non-Virtual objects  $D_x$  are marked (parameters must be set).
- All input edges  $( D_x, N_y )$  with an output edge  $( N_z, D_x )$  are unmarked.
- All input edges  $( D_x, N_y )$  where  $D_x$  is a Delay data object are marked.

Processing a node results in unmarking all the corresponding input edges and marking all its output edges; marking an output edge  $( N_x, D_y )$  where  $D_y$  is not a Delay results in marking all of the input edges  $( D_y, N_z )$ . Following these rules, it is possible to statically schedule the nodes in a graph as follows: Construct a precedence graph  $P$ , including all the nodes  $N_1 \dots N_n$ , and an edge  $( N_x, N_z )$  for every pair of edges  $( N_x, D_y )$  and  $( D_y, N_z )$  where  $D_y$  is not a Delay. Then unconditionally fire each node according to any topological sort of  $P$ .

The following assertions should be verified:

- $P$  is a Directed Acyclic Graph (DAG), implied by 4 and the way it is constructed.
- Every data object has a value when it is executed, implied by 5, 6, 7, and the marking.
- Execution is deterministic if the nodes are deterministic, implied by 3, 4, and the marking.
- Every node completes its execution exactly once.

The execution model described here just acts as a formalism. For example, independent processing is allowed across multiple depended and depending nodes and edges, provided that the result is invariant with the execution model described here.

### Contained & Overlapping Data Objects

There are cases in which two different data objects referenced by an output parameter of node  $N_1$  and input parameter of node  $N_2$  in a graph induce a dependency between these two nodes: For example, a pyramid and its level images, image and the sub-images created from it by `vxCreateImageFromROI` or `vxCreateImageFromChannel`, or overlapping sub-images of the same image. Following figure show examples of this dependency. To simplify subsequent definitions and requirements a limitation is imposed that if a sub-image  $I'$  has been created from image  $I$  and sub-image  $I''$  has been created from  $I'$ , then  $I''$  is still considered a sub-image of  $I$  and not of  $I'$ . In these cases it is expected that although the two nodes reference two different data objects, any change to one data object might be reflected in the other one. Therefore it implies that  $N_1$  comes before  $N_2$  in the graph's topological order. To ensure that, following definitions are introduced.

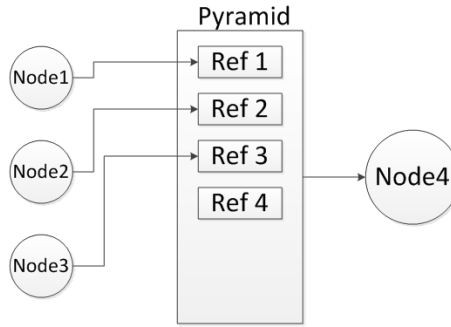

Figure 2.2: Pyramid Example

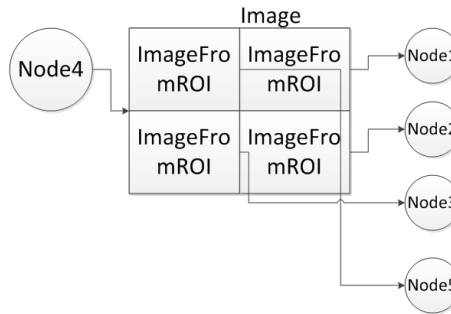

Figure 2.3: Image Example

1. *Containment Set* -  $C(d)$ , the set of recursively contained data objects of  $d$ , named *Containment Set*, is defined as follows:

- $C_0(d) = \{d\}$
- $C_1(d)$  is the set of all data objects that are *directly contained* by  $d$ :
  - (a) If  $d$  is an image, all images created from an ROI or channel of  $d$  are directly contained by  $d$ .
  - (b) If  $d$  is a pyramid, all pyramid levels of  $d$  are directly contained by  $d$ .
  - (c) If  $d$  is an object array, all elements of  $d$  are directly contained by  $d$ .
  - (d) If  $d$  is a delay object, all slots of  $d$  are directly contained by  $d$ .
- For  $i > 1$ ,  $C_i(d)$  is the set of all data objects that are contained by  $d$  at the  $i^{th}$  order

$$C_i(d) = \bigcup_{d' \in C_{i-1}(d)} C_1(d') \quad (2.1)$$

- $C(d)$  is the set that contains  $d$  itself, the data objects *contained* by  $d$ , the data objects that are contained by the data objects contained by  $d$  and so on. Formally:

$$C(d) = \bigcup_{i=0}^{\infty} C_i(d) \quad (2.2)$$

2.  $I(d)$  is a predicate that equals true if and only if  $d$  is an image.
3. *Overlapping Relationship* - The overlapping relation  $R_{ov}$  is a relation defined for images, such that if  $i_1$  and  $i_2$  in  $C(i)$ ,  $i$  being an image, then  $i_1 R_{ov} i_2$  is true if and only if  $i_1$  and  $i_2$  overlap, i.e there exists a point (x,y) of  $i$  that is contained in both  $i_1$  and  $i_2$ . Note that this relation is reflexive and symmetric, but not transitive:  $i_1$  overlaps  $i_2$  and  $i_2$  overlaps  $i_3$  does not necessarily imply that  $i_1$  overlaps  $i_3$ , as illustrated in the following figure:

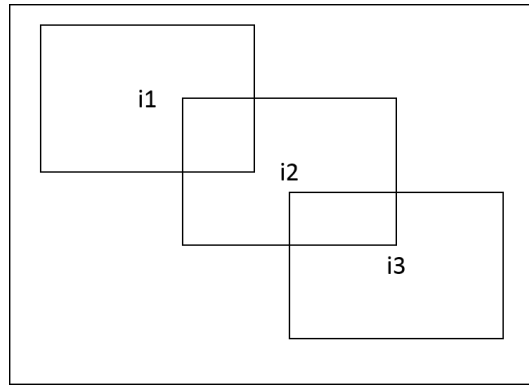

Figure 2.4: Overlap Example

4. *Dependency Relationship* - The dependency relationship  $N_1 \rightarrow N_2$ , is a relation defined for nodes.  $N_1 \rightarrow N_2$  means that  $N_2$  depends on  $N_1$  and then implies that  $N_2$  must be executed after the completion of  $N_1$ .
5.  $N_1 \rightarrow N_2$  if  $N_1$  writes to a data object  $d_1$  and  $N_2$  reads from a data object  $d_2$  and:

$$d_1 \in C(d_2) \text{ or } d_2 \in C(d_1) \text{ or } (I(d_1) \text{ and } I(d_2) \text{ and } d_1 R_{ov} d_2) \quad (2.3)$$

## 2.8.7 Node Execution Independence

In the following example a client computes the gradient magnitude and gradient phase from a blurred input image. The `vxMagnitudeNode` and `vxPhaseNode` are *independently* computed, in that each does not depend on the output of the other. OpenVX does not mandate that they are run simultaneously or in parallel, but it could be implemented this way by the OpenVX vendor.

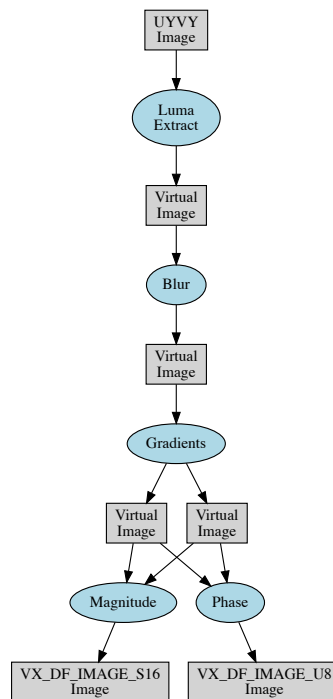

Figure 2.5: A simple graph with some independent nodes.

The code to construct such a graph can be seen below.

```

vx_context context = vxCreateContext();
vx_image images[] = {
 vxCreateImage(context, 640, 480, VX_DF_IMAGE_UYVY),
 vxCreateImage(context, 640, 480, VX_DF_IMAGE_S16),
 vxCreateImage(context, 640, 480, VX_DF_IMAGE_U8),
};

vx_graph graph = vxCreateGraph(context);
vx_image virts[] = {
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
};

vxChannelExtractNode(graph, images[0], VX_CHANNEL_Y, virts[0]),
vxGaussian3x3Node(graph, virts[0], virts[1]),
vxSobel3x3Node(graph, virts[1], virts[2], virts[3]),
vxMagnitudeNode(graph, virts[2], virts[3], images[1]),
vxPhaseNode(graph, virts[2], virts[3], images[2]),

status = vxVerifyGraph(graph);
if (status == VX_SUCCESS)
{
 status = vxProcessGraph(graph);
}
vxReleaseContext(&context); /* this will release everything */

```

### 2.8.8 Verification

Graphs within OpenVX must go through a rigorous validation process before execution to satisfy the design concept of eliminating run-time overhead (parameter checking) that guarantees safe execution of the graph. OpenVX must check for (but is not limited to) these conditions:

Parameters To Nodes:

- Each required parameter is given to the node ([The parameter state type constants](#)). Optional parameters may not be present and therefore are not checked when absent. If present, they are checked.
- Each parameter given to a node must be of the right *direction* (a value from [Parameter direction enumeration](#)).
- Each parameter given to a node must be of the right *object type* (from the object range of [The VX\\_TYPE Constants](#)).
- Each parameter attribute or value must be verified. In the case of a scalar value, it may need to be range checked (e.g.,  $0.5 \leq k \leq 1.0$ ). The implementation is not required to do run-time range checking of scalar values. If the value of the scalar changes at run time to go outside the range, the results are undefined. The rationale is that the potential performance hit for run-time range checking is too large to be enforced. It will still be checked at graph verification time as a time-zero sanity check. If the scalar is an output parameter of another node, it must be initialized to a legal value. In the case of `vxScaleImageNode`, the relation of the input image dimensions to the output image dimensions determines the scaling factor. These values or attributes of data objects must be checked for compatibility on each platform.
- Graph Connectivity - the `vx_graph` must be a Directed Acyclic Graph (DAG). No cycles or feedback is allowed. The `vx_delay` object has been designed to explicitly address feedback between Graph executions.
- Resolution of Virtual Data Objects - Any changes to *Virtual* data objects from unspecified to specific format or dimensions, as well as the related creation of objects of specific type that are observable at processing time, takes place at Verification time.

The implementation must check that all node parameters are the correct type at node creation time, unless the parameter value is set to NULL. Additional checks may also be made on non-NULL parameters. The user must be allowed to set parameters to NULL at node creation time, even if they are required parameters, in order to create "exemplar" nodes that are not used in graph execution, or to create nodes incrementally. Therefore the implementation must not generate an error at node creation time for parameters that are explicitly set to NULL. However, the implementation must check that all required parameters are non-NULL and the correct type during `vxVerifyGraph`. Other more complex checks may also be done during `vxVerifyGraph`. The implementation should provide specific error reporting of NULL parameters during `vxVerifyGraph`, e.g., "Parameter<parameter> of Node<node> is NULL."

## 2.9 Callbacks

Callbacks are a method to control graph flow and to make decisions based on completed work. The `vxAssignNodeCallback` call takes as a parameter a callback function. This function will be called after the execution of the particular node, but prior to the completion of the graph. If nodes are arranged into independent sets, the order of the callbacks is unspecified. Nodes that are arranged in a serial fashion due to data dependencies perform callbacks in order. The callback function may use the node reference first to extract parameters from the node, and then extract the data references. Data outputs of Nodes with callbacks shall be available (via Map/Unmap/Copy methods) when the callback is called.

## 2.10 User Kernels

OpenVX supports the concept of *client-defined functions* that shall be executed as *Nodes* from inside the Graph or are Graph *internal*. The purpose of this paradigm is to:

- Further exploit independent operation of nodes within the OpenVX platform.
- Allow componentized functions to be reused elsewhere in OpenVX.

- Formalize strict verification requirements (i.e., Contract Programming).

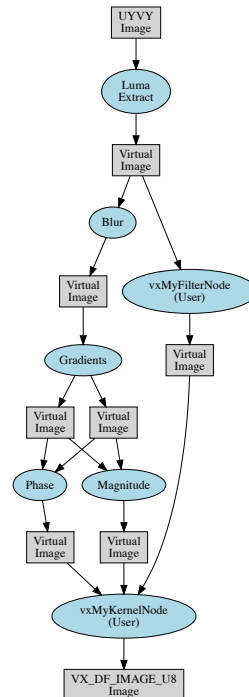

Figure 2.6: A graph with User Kernel nodes which are independent of the “base” nodes.

In this example, to execute client-supplied functions, the graph does not have to be halted and then resumed. These nodes shall be executed in an independent fashion with respect to independent base nodes within OpenVX. This allows implementations to further minimize execution time if hardware to exploit this property exists.

### 2.10.1 Parameter Validation

User Kernels must aid in the Graph Verification effort by providing an explicit validation function for each vision function they implement. Each parameter passed to the instantiated Node of a User Kernel is validated using the client-supplied validation function. The client must check these attributes and/or values of each parameter:

- Each attribute or value of the parameter must be checked. For example, the size of array, or the value of a scalar to be within a range, or a dimensionality constraint of an image such as width divisibility. (Some implementations may have restrictions, such as an image width be evenly divisible by some fixed number).
- If the output parameters depend on attributes or values from input parameters, those relationships must be checked.

### The Meta Format Object

The Meta Format Object is an opaque object used to collect requirements about the output parameter, which then the OpenVX implementation will check. The Client must manually set relevant object attributes to be checked against output parameters, such as dimensionality, format, scaling, etc.

## 2.10.2 User Kernels Naming Conventions

User Kernels must be exported with a unique name (see [Naming Conventions](#) for information on OpenVX conventions) and a unique enumeration. Clients of OpenVX may use either the name or enumeration to retrieve a kernel, so collisions due to non-unique names will cause problems. The kernel enumerations may be extended by following this example:

```
#define VX_KERNEL_NAME_KHR_XYZ "org.khronos.example.xyz"

#define VX_LIBRARY_XYZ (0x3) // assigned from Khronos, vendors control their own

#define VX_KERNEL_KHR_XYZ (VX_ENUM_KERNEL(VX_ID_DEFAULT, VX_LIBRARY_XYZ, 0x0))
// up to 0xFFF kernel enums can be created.
```

Each vendor of a vision function or an implementation must apply to Khronos to get a unique identifier (up to a limit of  $2^{12} - 1$  vendors). Until they obtain a unique ID vendors must use `VX_ID_DEFAULT`.

To construct a kernel enumeration, a vendor must have both their ID and a *library* ID. The library ID's are completely *vendor* defined (however when using the `VX_ID_DEFAULT` ID, many libraries may collide in namespace).

Once both are defined, a kernel enumeration may be constructed using the `VX_KERNEL_BASE` macro and an offset. (The offset is optional, but very helpful for long enumerations.)

## 2.11 Targets

A 'Target' specifies a physical or logical devices where a node is executed. This allows the use of different implementations of vision functions on different targets. The existence of allowed Targets is exposed to the applications by the use of defined APIs. The choice of a Target allows for different levels of control on where the nodes can be executed. An OpenVX implementation must support at least one target. Additional supported targets are specified using the appropriate enumerations. See `vxSetNodeTarget`, and [The Target Enumeration Constants](#). An OpenVX implementation must support at least one target `VX_TARGET_ANY` as well as `VX_TARGET_STRING` enumerates. An OpenVX implementation may also support more than these two to indicate the use of specific devices. For example, an implementation may add `VX_TARGET_CPU` and `VX_TARGET_GPU` enumerates to indicate the support of two possible targets to assign a nodes to . Another way an implementation can indicate the existence of multiple targets, for example CPU and GPU, is by specifying the target as `VX_TARGET_STRING` and using strings 'CPU' and 'GPU'. Thus defining targets using names rather than enumerates. The specific naming of string or enumerates is not enforced by the specification and it is up to the vendors to document and communicate the Target naming. Once available in a given implementation Applications can assign a Target to a node to specify the target that must execute that node by using the API `vxSetNodeTarget`.

## 2.12 Base Vision Functions

OpenVX comes with a standard or *base* set of vision functions. The following table lists the supported set of vision functions, their input types (first table) and output types (second table), and the version of OpenVX in which they are supported.

### 2.12.1 Inputs

| Vision Function    | U8  | U16 | S16        | U32 | S32 | F32 | color |
|--------------------|-----|-----|------------|-----|-----|-----|-------|
| AbsDiff            | 1.0 |     | 1.↔<br>0.1 |     |     |     |       |
| Accumulate         | 1.0 |     |            |     |     |     |       |
| AccumulateSquared  | 1.0 |     |            |     |     |     |       |
| AccumulateWeighted | 1.0 |     |            |     |     |     |       |
| Add                | 1.0 |     | 1.0        |     |     |     |       |
| And                | 1.0 |     |            |     |     |     |       |
| Box3x3             | 1.0 |     |            |     |     |     |       |
| CannyEdgeDetector  | 1.0 |     |            |     |     |     |       |
| ChannelCombine     | 1.0 |     |            |     |     |     |       |
| ChannelExtract     |     |     |            |     |     |     | 1.0   |

| Vision Function      | U8  | U16 | S16 | U32 | S32 | F32 | color |
|----------------------|-----|-----|-----|-----|-----|-----|-------|
| ColorConvert         |     |     |     |     |     |     | 1.0   |
| ConvertDepth         | 1.0 |     | 1.0 |     |     |     |       |
| Convolve             | 1.0 |     |     |     |     |     |       |
| Dilate3x3            | 1.0 |     |     |     |     |     |       |
| EqualizeHistogram    | 1.0 |     |     |     |     |     |       |
| Erode3x3             | 1.0 |     |     |     |     |     |       |
| FastCorners          | 1.0 |     |     |     |     |     |       |
| Gaussian3x3          | 1.0 |     |     |     |     |     |       |
| HarrisCorners        | 1.0 |     |     |     |     |     |       |
| HalfScaleGaussian    | 1.0 |     |     |     |     |     |       |
| Histogram            | 1.0 |     |     |     |     |     |       |
| IntegrallImage       | 1.0 |     |     |     |     |     |       |
| TableLookup          | 1.0 |     | 1.1 |     |     |     |       |
| LaplacianPyramid     | 1.1 |     |     |     |     |     |       |
| LaplacianReconstruct |     |     | 1.1 |     |     |     |       |
| Magnitude            |     |     | 1.0 |     |     |     |       |

## 2.13 Lifecycles

### 2.13.1 OpenVX Context Lifecycle

The lifecycle of the context is very simple.

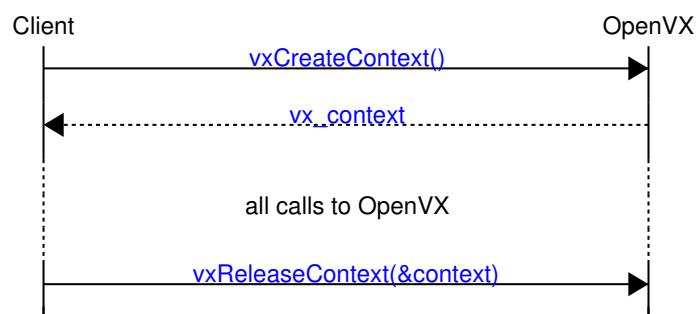

Figure 2.7: The lifecycle model for an OpenVX Context.

### 2.13.2 Graph Lifecycle

OpenVX has four main phases of graph lifecycle:

- Construction - Graphs are created via `vxCreateGraph`, and Nodes are connected together by data objects.

- Verification - The graphs are checked for consistency, correctness, and other conditions. Memory allocation may occur.
- Execution - The graphs are executed via `vxProcessGraph` or `vxScheduleGraph`. Between executions data may be updated by the client or some other external mechanism. The client of OpenVX may change reference of input data to a graph, but this may require the graph to be validated again by checking `vxIsGraphVerified`.
- Deconstruction - Graphs are released via `vxReleaseGraph`. All Nodes in the Graph are released.

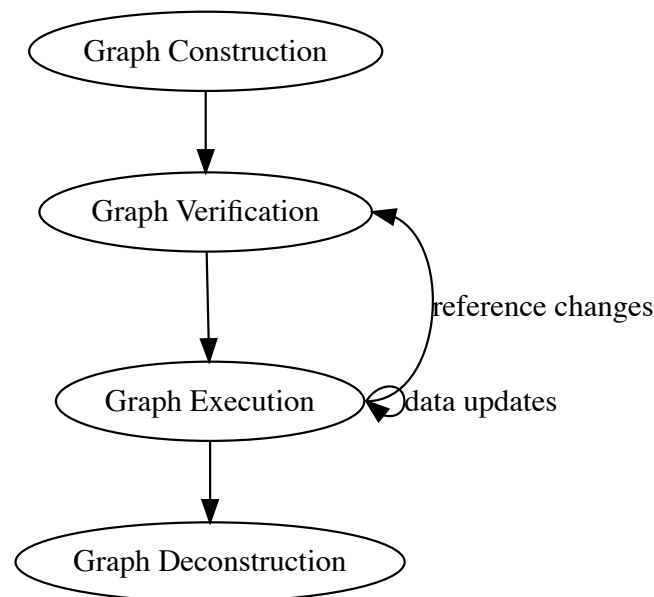

Figure 2.8: Graph Lifecycle

### 2.13.3 Data Object Lifecycle

All objects in OpenVX follow a similar lifecycle model. All objects are

- Created via `vxCreate<Object><Method>` or retrieved via `vxGet<Object><Method>` from the parent object if they are internally created.
- Used within Graphs.
- Then objects must be released via `vxRelease<Object>` or via `vxReleaseContext` when all objects are released.

#### OpenVX Image Lifecycle

This is an example of the Image Lifecycle using the OpenVX Framework API. This would also apply to other data types with changes to the types and function names.

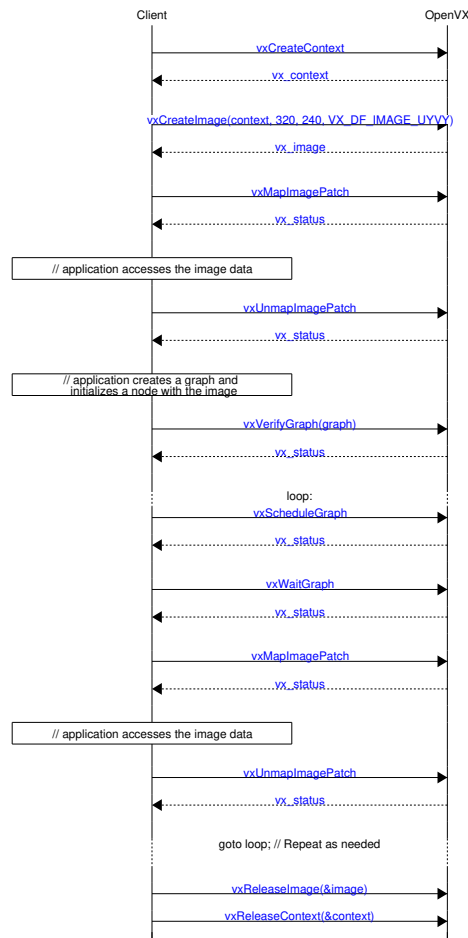

Figure 2.9: Image Object Lifecycle

## 2.14 Host Memory Data Object Access Patterns

For objects retrieved from OpenVX that are 2D in nature, such as `vx_image`, `vx_matrix`, and `vx_convolution`, the manner in which the host-side has access to these memory regions is well-defined. OpenVX uses a row-major storage (that is each unit in a column is memory-adjacent to its row adjacent unit). Two-dimensional objects are always created (using `vxCreateImage` or `vxCreateMatrix`) in width (columns) by height (rows) notation, with the arguments in that order. When accessing these structures in “C” with two-dimensional arrays of declared size, the user must therefore provide the array dimensions in the reverse of the order of the arguments to the Create function. This layout ensures *row-wise* storage in C on the host. A pointer could also be allocated for the matrix data and would have to be indexed in this row-major method.

### 2.14.1 Matrix Access Example

```

const vx_size columns = 3;
const vx_size rows = 4;
vx_matrix matrix = vxCreateMatrix(context,
 VX_TYPE_FLOAT32, columns, rows);
vx_status status = vxGetStatus((vx_reference)matrix);
if (status == VX_SUCCESS)
{
 vx_int32 j, i;
 #if defined(OPENVX_USE_C99)
 vx_float32 mat[rows][columns]; /* note: row major */
 #else
 vx_float32 *mat = (vx_float32 *)malloc(rows*columns*sizeof(
 vx_float32));
 #endif
 if (vxCopyMatrix(matrix, mat, VX_READ_ONLY,
 VX_MEMORY_TYPE_HOST) == VX_SUCCESS) {
 for (j = 0; j < (vx_int32)rows; j++)

```

```

 for (i = 0; i < (vx_int32)columns; i++)
 #if defined(OPENVX_USE_C99)
 mat[j][i] = (vx_float32)rand() / (vx_float32)RAND_MAX;
 #else
 mat[j*columns + i] = (vx_float32)rand() / (
vx_float32)RAND_MAX;
 #endif
 vxCopyMatrix(matrix, mat, VX_WRITE_ONLY,
VX_MEMORY_TYPE_HOST);
 }
 #if !defined(OPENVX_USE_C99)
 free(mat);
 #endif
}

```

## 2.14.2 Image Access Example

Images and Array differ slightly in how they are accessed due to more complex memory layout requirements.

```

vx_status status = VX_SUCCESS;
void *base_ptr = NULL;
vx_uint32 width = 640, height = 480, plane = 0;
vx_image image = vxCreateImage(context, width, height,
VX_DF_IMAGE_U8);
vx_rectangle_t rect;
vx_imagepatch_addressing_t addr;
vx_map_id map_id;

rect.start_x = rect.start_y = 0;
rect.end_x = rect.end_y = PATCH_DIM;

status = vxMapImagePatch(image, &rect, plane, &map_id,
&addr, &base_ptr,
VX_READ_AND_WRITE,
VX_MEMORY_TYPE_HOST, 0);
if (status == VX_SUCCESS)
{
 vx_uint32 x,y,i,j;
 vx_uint8 pixel = 0;

 /* a couple addressing options */

 /* use linear addressing function/macro */
 for (i = 0; i < addr.dim_x*addr.dim_y; i++) {
 vx_uint8 *ptr2 = vxFormatImagePatchAddress1d(base_ptr,
i, &addr);
 *ptr2 = pixel;
 }

 /* 2d addressing option */
 for (y = 0; y < addr.dim_y; y+=addr.step_y) {
 for (x = 0; x < addr.dim_x; x+=addr.step_x) {
 vx_uint8 *ptr2 = vxFormatImagePatchAddress2d(base_ptr,
x, y, &addr);
 *ptr2 = pixel;
 }
 }

 /* direct addressing by client
 * for subsampled planes, scale will change
 */
 for (y = 0; y < addr.dim_y; y+=addr.step_y) {
 for (x = 0; x < addr.dim_x; x+=addr.step_x) {
 vx_uint8 *tmp = (vx_uint8 *)base_ptr;
 i = ((addr.stride_y*y*addr.scale_y) /
VX_SCALE_UNITY) +
((addr.stride_x*x*addr.scale_x) /
VX_SCALE_UNITY);
 tmp[i] = pixel;
 }
 }

 /* more efficient direct addressing by client.
 * for subsampled planes, scale will change.
 */
 for (y = 0; y < addr.dim_y; y+=addr.step_y) {
 j = (addr.stride_y*y*addr.scale_y)/VX_SCALE_UNITY;
 for (x = 0; x < addr.dim_x; x+=addr.step_x) {
 vx_uint8 *tmp = (vx_uint8 *)base_ptr;
 i = j + (addr.stride_x*x*addr.scale_x) /
VX_SCALE_UNITY;
 tmp[i] = pixel;
 }
 }
}

```

```

 /* this commits the data back to the image.
 */
 status = vxUnmapImagePatch(image, map_id);
}
vxReleaseImage(&image);

```

### 2.14.3 Array Access Example

Arrays only require a single value, the stride, instead of the entire addressing structure that images need.

```

vx_size i, stride = sizeof(vx_size);
void *base = NULL;
vx_map_id map_id;
/* access entire array at once */
vxMapArrayRange(array, 0, num_items, &map_id, &stride, &base,
VX_READ_AND_WRITE, VX_MEMORY_TYPE_HOST, 0);
for (i = 0; i < num_items; i++)
{
 vxArrayItem(mystruct, base, i, stride).some_uint += i;
 vxArrayItem(mystruct, base, i, stride).some_double = 3.14f;
}
vxUnmapArrayRange(array, map_id);

```

Map/Unmap pairs can also be called on individual elements of array using a method similar to this:

```

/* access each array item individually */
for (i = 0; i < num_items; i++)
{
 mystruct *myptr = NULL;
 vxMapArrayRange(array, i, i+1, &map_id, &stride, (void **)&myptr,
VX_READ_AND_WRITE, VX_MEMORY_TYPE_HOST, 0);
 myptr->some_uint += 1;
 myptr->some_double = 3.14f;
 vxUnmapArrayRange(array, map_id);
}

```

## 2.15 Concurrent Data Object Access

Accessing OpenVX data-objects using the functions Map, Copy, Read concurrently to an execution of a graph that is accessing the same data objects is permitted only if all accesses are read-only. That is, for Map, Copy to have a read-only access mode and for nodes in the graph to have that data-object as an input parameter only. In all other cases, including write or read-write modes and Write access function, as well as a graph nodes having the data-object as output or bidirectional, the application must guarantee that the access is not performed concurrently with the graph execution. That can be achieved by calling un-map following a map before calling [vxScheduleGraph](#) or [vxProcessGraph](#). In addition, the application must call [vxWaitGraph](#) after [vxScheduleGraph](#) before calling Map, Read, Write or Copy to avoid restricted concurrent access. An application that fails to follow the above might encounter an undefined behavior and/or data loss without being notified by the OpenVX framework. Accessing images created from ROI ([vxCreateImageFromROI](#)) or created from a channel ([vxCreateImageFromChannel](#)) must be treated as if the entire image is being accessed.

- Setting an attribute is considered as writing to a data object in this respect.
- For concurrent execution of several graphs please see [Execution Model](#)
- Also see the graph formalism section for guidance on accessing ROIs of the same image within a graph.

## 2.16 Valid Image Region

The valid region mechanism informs the application as to which pixels of the output images of a graph's execution have valid values (see valid pixel definition below). The mechanism supports the communication of the valid region between different graph executions. Some vision functions, mainly those providing statistics and summarization of image information, use the valid region to ignore pixels that are not valid on their inputs (potentially bad or unstable pixel values). A good example of such a function is Min/Max Location. Formalization of the valid region mechanism is given below.

- Valid Pixels - All output pixels of an OpenVX function are considered valid by default, unless their calculation depends on input pixels that are not valid. An input pixel is not valid in one of two situations:

1. The pixel is outside of the image border and the border mode in use is `VX_BORDER_UNDEFINED`
  2. The pixel is outside the valid region of the input image.
- Valid Region - The region in the image that contains all the valid pixels. Theoretically this can be of any shape. OpenVX currently only supports rectangular valid regions. In subsequent text the term 'valid rectangle' denotes a valid region that is rectangular in shape.
  - Valid Rectangle Reset - In some cases it is not possible to calculate a valid rectangle for the output image of a vision function (for example, warps and remap). In such cases, the vision function is said to reset the valid Region to the entire image. The attribute `VX_NODE_VALID_RECT_RESET` is a read only attribute and is used to communicate valid rectangle reset behavior to the application. When it is set to `vx_true_e` for a given node the valid rectangle of the output images will reset to the full image upon execution of the node, when it is set to `vx_false_e` the valid rectangle will be calculated. All standard OpenVX functions will have this attribute set to `vx_false_e` by default, except for Warp and Remap where it will be set to `vx_true_e`.
  - Valid Rectangle Initialization - Upon the creation of an image, its valid rectangle is the entire image. One exception to this is when creating an image via `vxCreateImageFromROI`; in that case, the valid region of the ROI image is the subset of the valid region of the parent image that is within the ROI. In other words, the valid region of an image created using an ROI is the largest rectangle that contains valid pixels in the parent image.
  - Valid Rectangle Calculation - The valid rectangle of an image changes as part of the graph execution, the correct value is guaranteed only when the execution finishes. The valid rectangle of an image remains unchanged between graph executions and persists between graph executions as long as the application doesn't explicitly change the valid region via `vxSetImageValidRectangle`. Notice that using `vxMapImagePatch`, `vxUnmapImagePatch` or `vxSwapImageHandle` does not change the valid region of an image. If a non-UNDEFINED border mode is used on an image where the valid region is not the full image, the results at the border and resulting size of the valid region are implementation-dependent. This case can occur when mixing UNDEFINED and other border mode, which is not recommended.
  - Valid Region Usage - For all standard OpenVX functions, the framework must guarantee that all pixel values inside the valid rectangle of the output images are valid. The framework does not guarantee that input pixels outside of the valid rectangle are processed. For the following vision functions, the framework guarantees that pixels outside of the valid rectangle do not participate in calculating the vision function result: Equalize Histogram, Integral Image, Fast Corners, Histogram, Mean and Standard Deviation, Min Max Location, Optical Flow Pyramid (LK) and Canny Edge Detector. An application can get the valid rectangle of an image by using `vxGetValidRegionImage`.
  - User kernels - User kernels may change the valid rectangles of their output images. To change the valid rectangle, the programmer of the user kernel must provide a call-back function that sets the valid rectangle. The output validator of the user kernel must provide this callback by setting the value of the `vx_meta_format` attribute `VX_VALID_RECT_CALLBACK` during the output validator. The callback function must be callable by the OpenVX framework during graph validation and execution. Assumptions must not be made regarding the order and the frequency by which the valid rectangle callback is called. The framework will recalculate the valid region when a change in the input valid regions is detected. For user nodes, the default value of `VX_NODE_VALID_RECT_RESET` is `vx_true_e`. Setting `VX_VALID_RECT_CALLBACK` during parameter validation to a value other than NULL will result in setting `VX_NODE_VALID_RECT_RESET` to `vx_false_e`. Note: the above means that when `VX_VALID_RECT_CALLBACK` is not set or set to NULL the user-node will reset the valid rectangle to the entire image.
  - In addition, valid rectangle reset occurs in the following scenarios:
    1. A reset of the valid rectangle of a parent image when a node writes to one of its ROIs. The only case where the reset does not occur is when the child ROI image is identical to the parent image.
    2. For nodes that have the `VX_NODE_VALID_RECT_RESET` set to `vx_true_e`

## 2.17 Extending OpenVX

Beyond [User Kernels](#) there are other mechanisms for vendors to extend features in OpenVX. These mechanisms are not available to User Kernels. Each OpenVX official extension has a unique identifier, comprised of capital letters, numbers and the underscore character, prefixed with "KHR\_", for example "KHR\_NEW\_FEATURE".

### 2.17.1 Extending Attributes

When extending attributes, vendors *must* use their assigned ID from [The Vendor ID list for OpenVX](#). in conjunction with the appropriate macros for creating new attributes with `VX_ATTRIBUTE_BASE`. The typical mechanism to extend a new attribute for some object type (for example a `vx_node` attribute from `VX_ID_TI`) would look like this:

```
enum {
 VX_NODE_TI_NEWTHING = VX_ATTRIBUTE_BASE(VX_ID_TI,
 VX_TYPE_NODE) + 0x0,
}
```

### 2.17.2 Vendor Custom Kernels

Vendors wanting to add more kernels to the base set supplied to OpenVX should provide a header of the form

```
#include <VX/vx_ext_<vendor>.h>
```

that contains definitions of each of the following.

- New Node Creation Function Prototype per function.

```
vx_node vxXYZNode(vx_graph graph, vx_image input,
 vx_uint32 value, vx_image output, vx_array temp);
```

- A new Kernel Enumeration(s) and Kernel String per function.

```
#define VX_KERNEL_NAME_KHR_XYZ "org.khronos.example.xyz"

#define VX_LIBRARY_XYZ (0x3) // assigned from Khronos, vendors control their own

#define VX_KERNEL_KHR_XYZ (VX_ENUM_KERNEL(VX_ID_DEFAULT, VX_LIBRARY_XYZ, 0x0))
// up to 0xFFFF kernel enums can be created.
```

This should come with good documentation for each new part of the extension. Ideally, these sorts of extensions should not require linking to new objects to facilitate usage.

### 2.17.3 Vendor Custom Extensions

Some extensions affect *base* vision functions and thus may be invisible to most users. In these circumstances, the vendor must report the supported extensions to the base nodes through the `VX_CONTEXT_EXTENSIONS` attribute on the context.

```
vx_char *tmp, *extensions = NULL;
vx_size size = 0;
vxQueryContext(context, VX_CONTEXT_EXTENSIONS_SIZE, &size, sizeof(
 size));
extensions = malloc(size);
vxQueryContext(context, VX_CONTEXT_EXTENSIONS,
 extensions, size);
```

Extensions in this list are dependent on the extension itself; they may or may not have a header and new kernels or framework feature or data objects. The common feature is that they are implemented and supported by the implementation vendor.

### 2.17.4 Hinting

The specification defines a Hinting API that allows Clients to feed information to the implementation for *optional* behavior changes. See [Framework: Hints](#). It is assumed that most of the hints will be vendor- or implementation-specific. Check with the OpenVX implementation vendor for information on vendor-specific extensions.

### 2.17.5 Directives

The specification defines a Directive API to control implementation behavior. See [Framework: Directives](#). This *may* allow things like disabling parallelism for debugging, enabling cache writing-through for some buffers, or any implementation-specific optimization.

## 2.18 Import and Export Framework

OpenVX provides a way of exporting and importing pre-verified graphs or other objects, in vendor-specific formats, for use cases, such as:

- Embedded systems using fixed graphs, to minimise the amount of code required.
- Safety-critical systems where the OpenVX library does not have a node API.
- Extension (such as Neural Networks) which require the ability to import binary objects.

### 2.18.1 Import and Export of Objects

- Application must be able to specify which objects are to be exported.
- The framework will also export any other objects required; for example, if a graph is to be exported then all components of that graph will also be exported even if their references were not given.
- Upon Import, only those objects that were specified for export will be visible in the imported entity; all other objects may be present but are not directly accessible. For example, a pyramid object may be exported, in which case the levels of the pyramid will be available in the usual way. As another example, an image that is part of a pyramid is exported. Since an image has no API that allows accessing the pyramid of which it is part, then there is no requirement to export the rest of the pyramid.

### 2.18.2 Creation of Objects Upon Import

- To make it possible to implement certain scenarios, for example when an image needs to be created in a different way in the import environment than the export environment, certain objects may be created by the application and passed to the import routine. These objects need to be specified at the time of export, and provided again at the time of import.
- All other required objects will be created by the framework upon import.

### 2.18.3 Import and Export of Data Values For Objects To Be Created By The Framework

- Some objects may contain data values (as distinct from Meta Data) that require preservation across the export and import routines. The application can specify this at the time of export; those objects which are listed (by giving references) for export will then either be stripped of data values or have their data values entirely exported.
- For those objects which are **not** listed, the following rules apply:
  1. In any one graph, if an object is not connected as an output parameter then its data values will be exported (and imported).
  2. Where the object in (1) is a composite object such as a Pyramid or ObjectArray, then rule (1) applies to all sub-objects by definition.
  3. Where the object in (1) is a sub-object such as a Region Of Interest or member of an ObjectArray, and the composite object does not meet the conditions of rule (1), then rule (1) applies to the sub-object only.
  4. When objects are imported, the exported data values are assigned. However, if parts of the data were not defined at the time of export, then there is no guarantee that upon import the same values will be present. For example, consider an image where values had been written only to some (rectangular) part of the image before export. After import, only this part of the image will be guaranteed to contain the same values; those parts which were undefined before will be set to the default value for the data field. In the absence of any other definition the default value is zero.

- For those objects which **are** listed, then:
  - If the application requires, all defined values shall be exported.
  - The application requires, no values need be exported. The behavior here is as though no values had been defined (written) for the object.
  - Areas of undefined values will remain undefined (and possibly containing different random values) upon import.
  - All values are initialized upon import. If data was not defined, then it is set to the default value for the data field. In the absence of any other definition the default value is zero.

#### 2.18.4 Import and Export of Values For Objects To Be Created By The Application

- Objects created by the application before import of the binary object must have their data values defined by the application before the import operation.
- Sometimes changing the value stored in an object that is an input parameter of a verified graph will require that the graph is verified again before execution. If such an object is listed as to be supplied by the application, then the export operation will fail.

#### 2.18.5 Import and Export of Meta Data

- For all objects that are visible in the import, all query-able Meta Data must appear the same after import as before export.
- Objects created by the application before import and provided to the import API must match in type, size, etc. and therefore the export must export sufficient information for this check to be done.
- An Import may fail if the application-provided objects do not match those given at the time of export.
- Graphs with delays that are registered for auto-ageing at the time of export will be in the same condition after import of the objects.

#### 2.18.6 Restrictions Upon What References May Be Exported

- Export will fail if a `vx_context` is given in a list to export.
- Export will fail if a `vx_import` is given in a list to export. (`vx_import` is the type of the object returned by the import functions).
- Export will fail if a reference to a virtual object is given in the list to export.
- Export will fail if a `vx_node`, `vx_kernel`, or `vx_parameter` is given in the list to export.
- Export is otherwise defined for “objects”.

#### 2.18.7 Access To Object References In The Imported Object

- References are obtained from the import API for those objects whose references were listed at the time of export. These are not the same objects; they are equivalent objects created by the framework at import time. The implementation guarantees that references will be available and valid for all objects listed at the time of export, or the import will fail.
- References additionally may be obtained using a name given to an object before export.
- Before export, objects may be named for retrieval by name using the existing API `vx_status vxSetReferenceName(vx_reference ref, const vx_char * name)`.
- Export will fail if duplicate names are found for listed references.
- Import will fail if duplicate names are found in the import object.
- If references are obtained by name, only those objects whose references were listed at the time of export can be found by name.
- A `vx_node`, `vx_kernel`, or `vx_parameter` cannot be obtained from the import object.

## 2.19 Safety-critical Features

### 2.19.1 The Development and Deployment Feature Sets

The safety-critical environment (for example ISO26262) requires an implementation to satisfy rigorous demands for deployment. For development, an implementation must satisfy the lesser demands of a software tool used to create such a deployment. A developer may use the full set of development features to create and export a graph, and then for deployment this graph is imported by a program that only uses features in the deployment feature set.

The safety-critical environment requires that graphs must execute in a deterministic, reproducible way. It is up to the implementation to guarantee this behavior in some way.

This section defines the differences between deployment feature set and development feature set.

### 2.19.2 Node creation APIs

None of the `vxXXXNode()` functions in the “Vision Functions” section of the specification are in the deployment feature set (since graphs may not be constructed) and thus all requirements in that section are not directly applicable to the deployment feature set, and specifically none of the APIs defined in that section are applicable to the deployment feature set. However, the export and import APIs demand that a graph that has been exported and then imported must execute in the same way as before export. Hence it is implicit that all requirements relating to the operation of a graph built from nodes as defined by the “Vision Functions” section using the development feature set also apply to the operation of the same graph when it is executed using the deployment feature set.

For completeness, the following table lists the node creation functions that are present in the development feature set, but not in the deployment feature set.

| Node APIs, present only in the development feature set |                                      |                                            |
|--------------------------------------------------------|--------------------------------------|--------------------------------------------|
| <code>vxColorConvertNode</code>                        | <code>vxMeanStdDevNode</code>        | <code>vxLaplacianPyramidNode</code>        |
| <code>vxAddNode</code>                                 | <code>vxChannelExtractNode</code>    | <code>vxThresholdNode</code>               |
| <code>vxLaplacianReconstructNode</code>                | <code>vxSubtractNode</code>          | <code>vxChannelCombineNode</code>          |
| <code>vxIntegralImageNode</code>                       | <code>vxAccumulateImageNode</code>   | <code>vxConvertDepthNode</code>            |
| <code>vxPhaseNode</code>                               | <code>vxErode3x3Node</code>          | <code>vxAccumulateWeightedImageNode</code> |
| <code>vxCannyEdgeDetectorNode</code>                   | <code>vxSobel3x3Node</code>          | <code>vxDilate3x3Node</code>               |
| <code>vxAccumulateSquareImageNode</code>               | <code>vxWarpAffineNode</code>        | <code>vxMagnitudeNode</code>               |
| <code>vxMedian3x3Node</code>                           | <code>vxMinMaxLocNode</code>         | <code>vxWarpPerspectiveNode</code>         |
| <code>vxScaleImageNode</code>                          | <code>vxBox3x3Node</code>            | <code>vxAndNode</code>                     |
| <code>vxHarrisCornersNode</code>                       | <code>vxTableLookupNode</code>       | <code>vxGaussian3x3Node</code>             |
| <code>vxOrNode</code>                                  | <code>vxFastCornersNode</code>       | <code>vxHistogramNode</code>               |
| <code>vxNonLinearFilterNode</code>                     | <code>vxXorNode</code>               | <code>vxOpticalFlowPyrLKNode</code>        |
| <code>vxEqualizeHistNode</code>                        | <code>vxConvolveNode</code>          | <code>vxNotNode</code>                     |
| <code>vxRemapNode</code>                               | <code>vxAbsDiffNode</code>           | <code>vxGaussianPyramidNode</code>         |
| <code>vxMultiplyNode</code>                            | <code>vxHalfScaleGaussianNode</code> |                                            |

### 2.19.3 Basic and Administrative Features APIs

The rest of the framework API, as described in the “Basic Features” and “Administrative Features” sections of the specification are partitioned into those functions that are required for both development and deployment feature sets, and those that are required in the development feature set only. The following table lists these.

| API Group | API Function                       | Is deployment feature? |
|-----------|------------------------------------|------------------------|
| CONTEXT   | <code>vxCreateContext</code>       | Yes                    |
|           | <code>vxReleaseContext</code>      | Yes                    |
|           | <code>vxGetContext</code>          | Yes                    |
|           | <code>vxQueryContext</code>        | Yes                    |
|           | <code>vxSetContextAttribute</code> | Yes                    |
|           | <code>vxHint</code>                | Yes                    |
|           | <code>vxDirective</code>           | Yes                    |
|           | <code>vxGetStatus</code>           | Yes                    |
|           | <code>vxRegisterUserStruct</code>  |                        |

| API Group | API Function                                  | Is deployment feature? |
|-----------|-----------------------------------------------|------------------------|
|           | <a href="#">vxAllocateUserKernelId</a>        |                        |
|           | <a href="#">vxAllocateUserKernelLibraryId</a> |                        |
| IMAGE     | <a href="#">vxCreateImage</a>                 | Yes                    |
|           | <a href="#">vxCreateImageFromROI</a>          | Yes                    |
|           | <a href="#">vxCreateUniformImage</a>          | Yes                    |
|           | <a href="#">vxCreateVirtualImage</a>          |                        |
|           | <a href="#">vxCreateImageFromHandle</a>       | Yes                    |
|           | <a href="#">vxSwapImageHandle</a>             | Yes                    |
|           | <a href="#">vxQueryImage</a>                  | Yes                    |
|           | <a href="#">vxSetImageAttribute</a>           | Yes                    |
|           | <a href="#">vxReleaseImage</a>                | Yes                    |
|           | <a href="#">vxComputeImagePatchSize</a>       | Yes                    |
|           | <a href="#">vxFormatImagePatchAddress1d</a>   | Yes                    |
|           | <a href="#">vxFormatImagePatchAddress2d</a>   | Yes                    |
|           | <a href="#">vxGetValidRegionImage</a>         | Yes                    |
|           | <a href="#">vxCopyImagePatch</a>              | Yes                    |
|           | <a href="#">vxMapImagePatch</a>               | Yes                    |
|           | <a href="#">vxUnmapImagePatch</a>             | Yes                    |
|           | <a href="#">vxCreateImageFromChannel</a>      | Yes                    |
|           | <a href="#">vxSetImageValidRectangle</a>      | Yes                    |
| KERNEL    | <a href="#">vxLoadKernels</a>                 |                        |
|           | <a href="#">vxUnloadKernels</a>               |                        |
|           | <a href="#">vxGetKernelByName</a>             |                        |
|           | <a href="#">vxGetKernelByEnum</a>             |                        |
|           | <a href="#">vxQueryKernel</a>                 |                        |
|           | <a href="#">vxReleaseKernel</a>               |                        |
|           | <a href="#">vxAddUserKernel</a>               |                        |
|           | <a href="#">vxFinalizeKernel</a>              |                        |

#### 2.19.4 Attributes

The following two requirements are not part of the deployment feature set:

- Calling `vxQueryGraph` with the attribute `VX_GRAPH_NUMNODES`
- Calling `vxQueryGraph` with the attribute `VX_GRAPH_PERFORMANCE`

# Chapter 3

## Module Documentation

### 3.1 Vision Functions

#### 3.1.1 Detailed Description

These are the base vision functions supported in OpenVX 1.1.

These functions were chosen as a subset of a larger pool of possible functions that fall under the following criteria:

- Applicable to Acceleration Hardware
- Very Common Usage
- Encumbrance Free

#### Modules

- [Absolute Difference](#)  
*Computes the absolute difference between two images.*
- [Accumulate](#)  
*Accumulates an input image into output image.*
- [Accumulate Squared](#)  
*Accumulates a squared value from an input image to an output image.*
- [Accumulate Weighted](#)  
*Accumulates a weighted value from an input image to an output image.*
- [Arithmetic Addition](#)  
*Performs addition between two images.*
- [Arithmetic Subtraction](#)  
*Performs subtraction between two images.*
- [Bitwise AND](#)  
*Performs a bitwise AND operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00023].*
- [Bitwise EXCLUSIVE OR](#)  
*Performs a bitwise EXCLUSIVE OR (XOR) operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00025].*
- [Bitwise INCLUSIVE OR](#)  
*Performs a bitwise INCLUSIVE OR operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00027].*
- [Bitwise NOT](#)  
*Performs a bitwise NOT operation on a [VX\\_DF\\_IMAGE\\_U8](#) input image [R00029].*
- [Box Filter](#)  
*Computes a Box filter over a window of the input image.*
- [Canny Edge Detector](#)  
*Provides a Canny edge detector kernel.*
- [Channel Combine](#)

- Implements the Channel Combine Kernel.*

  - [Channel Extract](#)

*Implements the Channel Extraction Kernel.*
  - [Color Convert](#)

*Implements the Color Conversion Kernel.*
  - [Convert Bit depth](#)

*Converts image bit depth.*
  - [Custom Convolution](#)

*Convolve the input with the client supplied convolution matrix [R00047].*
  - [Dilate Image](#)

*Implements Dilation, which grows the white space in a `VX_DF_IMAGE_U8` Boolean image.*
  - [Equalize Histogram](#)

*Equalizes the histogram of a grayscale image.*
  - [Erode Image](#)

*Implements Erosion, which shrinks the white space in a `VX_DF_IMAGE_U8` Boolean image.*
  - [Fast Corners](#)

*Computes the corners in an image using a method based upon FAST9 algorithm suggested in [3] and with some updates from [4] with modifications described below [R00056].*
  - [Gaussian Filter](#)

*Computes a Gaussian filter over a window of the input image.*
  - [Non Linear Filter](#)

*Computes a non-linear filter over a window of the input image.*
  - [Harris Corners](#)

*Computes the Harris Corners of an image.*
  - [Histogram](#)

*Generates a distribution from an image.*
  - [Gaussian Image Pyramid](#)

*Computes a Gaussian Image Pyramid from an input image.*
  - [Laplacian Image Pyramid](#)

*Computes a Laplacian Image Pyramid from an input image.*
  - [Reconstruction from a Laplacian Image Pyramid](#)

*Reconstructs the original image from a Laplacian Image Pyramid.*
  - [Integral Image](#)

*Computes the integral image of the input.*
  - [Magnitude](#)

*Implements the Gradient Magnitude Computation Kernel.*
  - [Mean and Standard Deviation](#)

*Computes the mean pixel value and the standard deviation of the pixels in the input image (which has a dimension width and height).*
  - [Median Filter](#)

*Computes a median pixel value over a window of the input image [R00083].*
  - [Min, Max Location](#)

*Finds the minimum and maximum values in an image and a location for each [R00084].*
  - [Optical Flow Pyramid \(LK\)](#)

*Computes the optical flow using the Lucas-Kanade method between two pyramid images.*
  - [Phase](#)

*Implements the Gradient Phase Computation Kernel.*
  - [Pixel-wise Multiplication](#)

*Performs element-wise multiplication between two images and a scalar value.*
  - [Remap](#)

*Maps output pixels in an image from input pixels in an image.*

- [Scale Image](#)  
*Implements the Image Resizing Kernel.*
- [Sobel 3x3](#)  
*Implements the Sobel Image Filter Kernel.*
- [TableLookup](#)  
*Implements the Table Lookup Image Kernel.*
- [Thresholding](#)  
*Thresholds an input image and produces an output Boolean image.*
- [Warp Affine](#)  
*Performs an affine transform on an image.*
- [Warp Perspective](#)  
*Performs a perspective transform on an image.*

## 3.2 Absolute Difference

### 3.2.1 Detailed Description

Computes the absolute difference between two images.

Absolute Difference is computed by [R00001]:

$$out(x,y) = |in_1(x,y) - in_2(x,y)|$$

If one of the input images is of type `VX_DF_IMAGE_S16`, all values are converted to `vx_int32` and the overflow policy `VX_CONVERT_POLICY_SATURATE` is used [R00002].

$$out(x,y) = saturate_{int16}(|(int32)in_1(x,y) - (int32)in_2(x,y)|)$$

The output image can be `VX_DF_IMAGE_U8` only if both source images are `VX_DF_IMAGE_U8` and the output image is explicitly set to `VX_DF_IMAGE_U8` [R00003]. It is otherwise `VX_DF_IMAGE_S16` [R00004].

### Functions

- `vx_node VX_API_CALL vxAbsDiffNode (vx_graph graph, vx_image in1, vx_image in2, vx_image out)`  
[Graph] Creates an AbsDiff node.

### 3.2.2 Function Documentation

#### `vxAbsDiffNode()`

```
vx_node VX_API_CALL vxAbsDiffNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_image out)
```

[Graph] Creates an AbsDiff node.

#### Parameters

|     |              |                                                                                                  |
|-----|--------------|--------------------------------------------------------------------------------------------------|
| in  | <i>graph</i> | The reference to the graph [R00202].                                                             |
| in  | <i>in1</i>   | An input image in <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> format [R00203].   |
| in  | <i>in2</i>   | An input image in <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> format [R00204].   |
| out | <i>out</i>   | The output image in <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> format [R00205]. |

#### Returns

`vx_node` [R00206].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.3 Accumulate

### 3.3.1 Detailed Description

Accumulates an input image into output image.

Accumulation is computed by [R00005]:

$$accum(x,y) = accum(x,y) + input(x,y)$$

The overflow policy used is `VX_CONVERT_POLICY_SATURATE` [R00006].

### Functions

- `vx_node VX_API_CALL vxAccumulateImageNode (vx_graph graph, vx_image input, vx_image accum)`  
[Graph] Creates an accumulate node.

### 3.3.2 Function Documentation

#### `vxAccumulateImageNode()`

```
vx_node VX_API_CALL vxAccumulateImageNode (
 vx_graph graph,
 vx_image input,
 vx_image accum)
```

[Graph] Creates an accumulate node.

#### Parameters

|         |              |                                                                  |
|---------|--------------|------------------------------------------------------------------|
| in      | <i>graph</i> | The reference to the graph [R00266].                             |
| in      | <i>input</i> | The input <code>VX_DF_IMAGE_U8</code> image [R00267].            |
| in, out | <i>accum</i> | The accumulation image in <code>VX_DF_IMAGE_S16</code> [R00268]. |

#### Returns

`vx_node` [R00269].

#### Return values

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.4 Accumulate Squared

### 3.4.1 Detailed Description

Accumulates a squared value from an input image to an output image.

Accumulate squares is computed by [R00007]:

$$accum(x,y) = saturate_{int16}(((uint16)accum(x,y) + (((uint16)(input(x,y)^2)) >> (shift))))$$

Where  $0 \leq shift \leq 15$

The overflow policy used is `VX_CONVERT_POLICY_SATURATE` [R00008].

### Functions

- `vx_node VX_API_CALL vxAccumulateSquareImageNode (vx_graph graph, vx_image input, vx_scalar shift, vx_image accum)`

[Graph] Creates an accumulate square node.

### 3.4.2 Function Documentation

#### `vxAccumulateSquareImageNode()`

```
vx_node VX_API_CALL vxAccumulateSquareImageNode (
 vx_graph graph,
 vx_image input,
 vx_scalar shift,
 vx_image accum)
```

[Graph] Creates an accumulate square node.

#### Parameters

|         |                    |                                                                                                     |
|---------|--------------------|-----------------------------------------------------------------------------------------------------|
| in      | <code>graph</code> | The reference to the graph [R00274].                                                                |
| in      | <code>input</code> | The input <code>VX_DF_IMAGE_U8</code> image [R00275].                                               |
| in      | <code>shift</code> | The input <code>VX_TYPE_UINT32</code> with a value in the range of $0 \leq shift \leq 15$ [R00276]. |
| in, out | <code>accum</code> | The accumulation image in <code>VX_DF_IMAGE_S16</code> [R00277].                                    |

#### Returns

`vx_node` [R00278].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.5 Accumulate Weighted

### 3.5.1 Detailed Description

Accumulates a weighted value from an input image to an output image.

Weighted accumulation is computed by [R00009]:

$$accum(x,y) = (1 - \alpha) * accum(x,y) + \alpha * input(x,y)$$

Where  $0 \leq \alpha \leq 1$  Conceptually, the rounding for this is defined as [R00010]:

$$output(x,y) = uint8((1 - \alpha) * float32(int32(output(x,y))) + \alpha * float32(int32(input(x,y))))$$

### Functions

- `vx_node VX_API_CALL vxAccumulateWeightedImageNode (vx_graph graph, vx_image input, vx_scalar alpha, vx_image accum)`

[Graph] Creates a weighted accumulate node.

### 3.5.2 Function Documentation

#### vxAccumulateWeightedImageNode()

```
vx_node VX_API_CALL vxAccumulateWeightedImageNode (
 vx_graph graph,
 vx_image input,
 vx_scalar alpha,
 vx_image accum)
```

[Graph] Creates a weighted accumulate node.

#### Parameters

|         |              |                                                                                                                       |
|---------|--------------|-----------------------------------------------------------------------------------------------------------------------|
| in      | <i>graph</i> | The reference to the graph [R00270].                                                                                  |
| in      | <i>input</i> | The input <code>VX_DF_IMAGE_U8</code> image [R00271].                                                                 |
| in      | <i>alpha</i> | The input <code>VX_TYPE_FLOAT32</code> scalar value with a value in the range of $0.0 \leq \alpha \leq 1.0$ [R00272]. |
| in, out | <i>accum</i> | The <code>VX_DF_IMAGE_U8</code> accumulation image [R00273].                                                          |

#### Returns

`vx_node`.

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.6 Arithmetic Addition

### 3.6.1 Detailed Description

Performs addition between two images.

Arithmetic addition is performed between the pixel values in two `VX_DF_IMAGE_U8` or `VX_DF_IMAGE_S16` images [R00011]. The output image can be `VX_DF_IMAGE_U8` only if both source images are `VX_DF_IMAGE_U8` and the output image is explicitly set to `VX_DF_IMAGE_U8` [R00012]. It is otherwise `VX_DF_IMAGE_S16` [R00013]. If one of the input images is of type `VX_DF_IMAGE_S16`, all values are converted to `VX_DF_IMAGE_S16` [R00014]. The overflow handling is controlled by an overflow-policy parameter [R00015]. For each pixel value in the two input image [R00016]s:

$$out(x,y) = in_1(x,y) + in_2(x,y)$$

### Functions

- `vx_node VX_API_CALL vxAddNode (vx_graph graph, vx_image in1, vx_image in2, vx_enum policy, vx_image out)`

[Graph] Creates an arithmetic addition node.

### 3.6.2 Function Documentation

#### vxAddNode()

```
vx_node VX_API_CALL vxAddNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_enum policy,
 vx_image out)
```

[Graph] Creates an arithmetic addition node.

#### Parameters

|     |               |                                                                                                 |
|-----|---------------|-------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00320].                                                            |
| in  | <i>in1</i>    | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> [R00321].           |
| in  | <i>in2</i>    | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> [R00322].           |
| in  | <i>policy</i> | Use a <a href="#">The Conversion Policy Enumeration</a> . value [R00323].                       |
| out | <i>out</i>    | The output image, a <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> image. [R00324] |

#### Returns

`vx_node` [R00325].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.7 Arithmetic Subtraction

### 3.7.1 Detailed Description

Performs subtraction between two images.

Arithmetic subtraction is performed between the pixel values in two `VX_DF_IMAGE_U8` or two `VX_DF_IMAGE_S16` images [R00017]. The output image can be `VX_DF_IMAGE_U8` only if both source images are `VX_DF_IMAGE_U8` and the output image is explicitly set to `VX_DF_IMAGE_U8` [R00018]. It is otherwise `VX_DF_IMAGE_S16` [R00019]. If one of the input images is of type `VX_DF_IMAGE_S16`, all values are converted to `VX_DF_IMAGE_S16` [R00020]. The overflow handling is controlled by an overflow-policy parameter [R00021]. For each pixel value in the two input images [R00022]:

$$out(x,y) = in_1(x,y) - in_2(x,y)$$

### Functions

- `vx_node VX_API_CALL vxSubtractNode (vx_graph graph, vx_image in1, vx_image in2, vx_enum policy, vx_image out)`

[Graph] Creates an arithmetic subtraction node.

### 3.7.2 Function Documentation

#### `vxSubtractNode()`

```
vx_node VX_API_CALL vxSubtractNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_enum policy,
 vx_image out)
```

[Graph] Creates an arithmetic subtraction node.

#### Parameters

|     |               |                                                                                                        |
|-----|---------------|--------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00326].                                                                   |
| in  | <i>in1</i>    | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> , the minuend [R00327].    |
| in  | <i>in2</i>    | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> , the subtrahend [R00328]. |
| in  | <i>policy</i> | Use a <a href="#">The Conversion Policy Enumeration</a> . value [R00329].                              |
| out | <i>out</i>    | The output image, a <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> image [R00330].        |

#### Returns

`vx_node` [R00331].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.8 Bitwise AND

### 3.8.1 Detailed Description

Performs a *bitwise AND* operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00023].

Bitwise AND is computed by the following, for each bit in each pixel in the input images [R00024]:

$$out(x,y) = in_1(x,y) \wedge in_2(x,y)$$

Or expressed as C code:

```
out(x,y) = in_1(x,y) & in_2(x,y)
```

### Functions

- [vx\\_node VX\\_API\\_CALL vxAndNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) in1, [vx\\_image](#) in2, [vx\\_image](#) out)  
[Graph] Creates a bitwise AND node.

### 3.8.2 Function Documentation

#### vxAndNode()

```
vx_node VX_API_CALL vxAndNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_image out)
```

[Graph] Creates a bitwise AND node.

#### Parameters

|     |              |                                                           |
|-----|--------------|-----------------------------------------------------------|
| in  | <i>graph</i> | The reference to the graph [R00293].                      |
| in  | <i>in1</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00294].    |
| in  | <i>in2</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00295].    |
| out | <i>out</i>   | The <a href="#">VX_DF_IMAGE_U8</a> output image [R00296]. |

#### Returns

[vx\\_node](#) [R00297].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.9 Bitwise EXCLUSIVE OR

### 3.9.1 Detailed Description

Performs a *bitwise EXCLUSIVE OR* (XOR) operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00025].

Bitwise XOR is computed by the following, for each bit in each pixel in the input images [R00026]:

$$out(x,y) = in_1(x,y) \oplus in_2(x,y)$$

Or expressed as C code:

```
out(x,y) = in_1(x,y) ^ in_2(x,y)
```

### Functions

- [vx\\_node VX\\_API\\_CALL vxXorNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) in1, [vx\\_image](#) in2, [vx\\_image](#) out)  
[Graph] Creates a bitwise EXCLUSIVE OR node.

### 3.9.2 Function Documentation

#### vxXorNode()

```
vx_node VX_API_CALL vxXorNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_image out)
```

[Graph] Creates a bitwise EXCLUSIVE OR node.

#### Parameters

|     |              |                                                           |
|-----|--------------|-----------------------------------------------------------|
| in  | <i>graph</i> | The reference to the graph [R00303].                      |
| in  | <i>in1</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00304].    |
| in  | <i>in2</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00305].    |
| out | <i>out</i>   | The <a href="#">VX_DF_IMAGE_U8</a> output image [R00306]. |

#### Returns

[vx\\_node](#) [R00307].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.10 Bitwise INCLUSIVE OR

### 3.10.1 Detailed Description

Performs a *bitwise INCLUSIVE OR* operation between two [VX\\_DF\\_IMAGE\\_U8](#) images [R00027].

Bitwise INCLUSIVE OR is computed by the following, for each bit in each pixel in the input images [R00028]:

$$out(x,y) = in_1(x,y) \vee in_2(x,y)$$

Or expressed as C code:

```
out(x,y) = in_1(x,y) | in_2(x,y)
```

### Functions

- [vx\\_node VX\\_API\\_CALL vxOrNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) in1, [vx\\_image](#) in2, [vx\\_image](#) out)  
[Graph] Creates a bitwise INCLUSIVE OR node.

### 3.10.2 Function Documentation

#### vxOrNode()

```
vx_node VX_API_CALL vxOrNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_image out)
```

[Graph] Creates a bitwise INCLUSIVE OR node.

#### Parameters

|     |              |                                                           |
|-----|--------------|-----------------------------------------------------------|
| in  | <i>graph</i> | The reference to the graph [R00298].                      |
| in  | <i>in1</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00299].    |
| in  | <i>in2</i>   | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00300].    |
| out | <i>out</i>   | The <a href="#">VX_DF_IMAGE_U8</a> output image [R00301]. |

#### Returns

[vx\\_node](#) [R00302].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.11 Bitwise NOT

### 3.11.1 Detailed Description

Performs a *bitwise NOT* operation on a [VX\\_DF\\_IMAGE\\_U8](#) input image [R00029].

Bitwise NOT is computed by the following, for each bit in each pixel in the input image [R00030]:

$$out(x,y) = \overline{in(x,y)}$$

Or expressed as C code:

```
out(x,y) = ~in_1(x,y)
```

### Functions

- [vx\\_node VX\\_API\\_CALL vxNotNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_image](#) output)  
[Graph] Creates a bitwise NOT node.

### 3.11.2 Function Documentation

#### vxNotNode()

```
vx_node VX_API_CALL vxNotNode (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a bitwise NOT node.

#### Parameters

|     |               |                                                           |
|-----|---------------|-----------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00308].                      |
| in  | <i>input</i>  | A <a href="#">VX_DF_IMAGE_U8</a> input image [R00309].    |
| out | <i>output</i> | The <a href="#">VX_DF_IMAGE_U8</a> output image [R00310]. |

#### Returns

[vx\\_node](#) [R00311].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.12 Box Filter

### 3.12.1 Detailed Description

Computes a Box filter over a window of the input image.

This filter uses the following convolution matrix [R00031]:

$$\mathbf{K}_{box} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} * \frac{1}{9}$$

### Functions

- `vx_node VX_API_CALL vxBox3x3Node (vx_graph graph, vx_image input, vx_image output)`  
[Graph] Creates a Box Filter Node.

### 3.12.2 Function Documentation

#### vxBox3x3Node()

```
vx_node VX_API_CALL vxBox3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a Box Filter Node.

#### Parameters

|     |               |                                                                  |
|-----|---------------|------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00233].                             |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> format [R00234].  |
| out | <i>output</i> | The output image in <code>VX_DF_IMAGE_U8</code> format [R00235]. |

#### Returns

`vx_node` [R00236].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.13 Canny Edge Detector

### 3.13.1 Detailed Description

Provides a Canny edge detector kernel.

This function implements an edge detection algorithm similar to that described in [2]. The main components of the algorithm are:

- Gradient magnitude and orientation computation using a noise resistant operator (Sobel).
- Non-maximum suppression of the gradient magnitude, using the gradient orientation information.
- Tracing edges in the modified gradient image using hysteresis thresholding to produce a binary result.

The details of each of these steps are described below.

- **Gradient Computation:** Conceptually, the input image is convolved with vertical and horizontal Sobel kernels of the size indicated by the *gradient\_size* parameter. The Sobel kernels used for the gradient computation shall be as shown below. The two resulting directional gradient images ( $dx$  and  $dy$ ) are then used to compute a gradient magnitude image and a gradient orientation image. The norm used to compute the gradient magnitude is indicated by the *norm\_type* parameter, so the magnitude may be  $|dx| + |dy|$  for `VX_NORM_L1` or  $\sqrt{dx^2 + dy^2}$  for `VX_NORM_L2`. The gradient orientation image is quantized into 4 values: 0, 45, 90, and 135 degrees.

- For gradient size 3:

$$\mathbf{sobel}_x = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$$

$$\mathbf{sobel}_y = \text{transpose}(\mathbf{sobel}_x) = \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

- For gradient size 5:

$$\mathbf{sobel}_x = \begin{bmatrix} -1 & -2 & 0 & 2 & 1 \\ -4 & -8 & 0 & 8 & 4 \\ -6 & -12 & 0 & 12 & 6 \\ -4 & -8 & 0 & 8 & 4 \\ -1 & -2 & 0 & 2 & 1 \end{bmatrix}$$

$$\mathbf{sobel}_y = \text{transpose}(\mathbf{sobel}_x)$$

- For gradient size 7:

$$\mathbf{sobel}_x = \begin{bmatrix} -1 & -4 & -5 & 0 & 5 & 4 & 1 \\ -6 & -24 & -30 & 0 & 30 & 24 & 6 \\ -15 & -60 & -75 & 0 & 75 & 60 & 15 \\ -20 & -80 & -100 & 0 & 100 & 80 & 20 \\ -15 & -60 & -75 & 0 & 75 & 60 & 15 \\ -6 & -24 & -30 & 0 & 30 & 24 & 6 \\ -1 & -4 & -5 & 0 & 5 & 4 & 1 \end{bmatrix}$$

$$\mathbf{sobel}_y = \text{transpose}(\mathbf{sobel}_x)$$

- **Non-Maximum Suppression:** This is then applied such that a pixel is retained as a potential edge pixel if and only if its magnitude is greater than or equal to the pixels in the direction perpendicular to its edge orientation. For example, if the pixel's orientation is 0 degrees, it is only retained if its gradient magnitude is larger than that of the pixels at 90 and 270 degrees to it. If a pixel is suppressed via this condition, it must not appear as an edge pixel in the final output, i.e., its value must be 0 in the final output.
- **Edge Tracing:** The final edge pixels in the output are identified via a double thresholded hysteresis procedure. All retained pixels with magnitude above the *high* threshold are marked as known edge pixels (valued 255) in the final output image. All pixels with magnitudes less than or equal to the *low* threshold must not be marked as edge pixels in the final output. For the pixels in between the thresholds, edges are traced and marked as edges (255) in the output. This can be done by starting at the known edge pixels and moving in all eight directions recursively until the gradient magnitude is less than or equal to the low threshold.

- **Caveats:** The intermediate results described above are conceptual only; so for example, the implementation may not actually construct the gradient images and non-maximum-suppressed images. Only the final binary (0 or 255 valued) output image must be computed so that it matches the result of a final image constructed as described above [R00032].

## Modules

- [Normalization type constants.](#)

## Functions

- `vx_node VX_API_CALL vxCannyEdgeDetectorNode` (`vx_graph` graph, `vx_image` input, `vx_threshold` hyst, `vx_int32` gradient\_size, `vx_enum` norm\_type, `vx_image` output)

[Graph] Creates a Canny Edge Detection Node.

### 3.13.2 Function Documentation

#### vxCannyEdgeDetectorNode()

```
vx_node VX_API_CALL vxCannyEdgeDetectorNode (
 vx_graph graph,
 vx_image input,
 vx_threshold hyst,
 vx_int32 gradient_size,
 vx_enum norm_type,
 vx_image output)
```

[Graph] Creates a Canny Edge Detection Node.

#### Parameters

|     |                      |                                                                                                                                                                                                                                                                                       |
|-----|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>         | The reference to the graph [R00338].                                                                                                                                                                                                                                                  |
| in  | <i>input</i>         | The input <code>VX_DF_IMAGE_U8</code> image [R00339].                                                                                                                                                                                                                                 |
| in  | <i>hyst</i>          | The double threshold for hysteresis [R00340]. The threshold data_type shall be either <code>VX_TYPE_UINT8</code> or <code>VX_TYPE_INT16</code> [R00341]. The <code>VX_THRESHOLD_TRUE_VALUE</code> and <code>VX_THRESHOLD_FALSE_VALUE</code> of <code>vx_threshold</code> are ignored. |
| in  | <i>gradient_size</i> | The size of the Sobel filter window, must support at least 3, 5, and 7 [R00342].                                                                                                                                                                                                      |
| in  | <i>norm_type</i>     | A flag indicating the norm used to compute the gradient, <code>VX_NORM_L1</code> or <code>VX_NORM_L2</code> [R00343].                                                                                                                                                                 |
| out | <i>output</i>        | The output image in <code>VX_DF_IMAGE_U8</code> format with values either 0 or 255 [R00344].                                                                                                                                                                                          |

#### Returns

`vx_node`.

#### Return values

## 3.14 Channel Combine

### 3.14.1 Detailed Description

Implements the Channel Combine Kernel.

This kernel takes multiple [VX\\_DF\\_IMAGE\\_U8](#) planes to recombine them into a multi-planar or interleaved format from [Image Type Constants](#) [R00033]. The user must specify only the number of channels that are appropriate for the combining operation. If a user specifies more channels than necessary, the operation results in an error [R00034]. For the case where the destination image is a format with subsampling, the input channels are expected to have been subsampled before combining (by stretching and resizing).

### Functions

- [vx\\_node VX\\_API\\_CALL vxChannelCombineNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) plane0, [vx\\_image](#) plane1, [vx\\_image](#) plane2, [vx\\_image](#) plane3, [vx\\_image](#) output)

[Graph] Creates a channel combine node.

### 3.14.2 Function Documentation

#### vxChannelCombineNode()

```
vx_node VX_API_CALL vxChannelCombineNode (
 vx_graph graph,
 vx_image plane0,
 vx_image plane1,
 vx_image plane2,
 vx_image plane3,
 vx_image output)
```

[Graph] Creates a channel combine node.

#### Parameters

|     |               |                                                                                                      |
|-----|---------------|------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The graph reference [R00157].                                                                        |
| in  | <i>plane0</i> | The plane that forms channel 0. Must be <a href="#">VX_DF_IMAGE_U8</a> [R00158].                     |
| in  | <i>plane1</i> | The plane that forms channel 1. Must be <a href="#">VX_DF_IMAGE_U8</a> [R00159].                     |
| in  | <i>plane2</i> | [optional] [R00160] The plane that forms channel 2. Must be <a href="#">VX_DF_IMAGE_U8</a> [R00161]. |
| in  | <i>plane3</i> | [optional] [R00162] The plane that forms channel 3. Must be <a href="#">VX_DF_IMAGE_U8</a> [R00163]. |
| out | <i>output</i> | The output image. The format of the image must be defined, even if the image is virtual [R00164].    |

Returns

[vx\\_node](#) [R00165].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.15 Channel Extract

### 3.15.1 Detailed Description

Implements the Channel Extraction Kernel.

This kernel removes a single [VX\\_DF\\_IMAGE\\_U8](#) channel (plane) from a multi-planar or interleaved image format from [Image Type Constants](#) [R00035].

### Functions

- [vx\\_node VX\\_API\\_CALL vxChannelExtractNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_enum](#) channel, [vx\\_image](#) output)

[Graph] Creates a channel extract node.

### 3.15.2 Function Documentation

#### vxChannelExtractNode()

```
vx_node VX_API_CALL vxChannelExtractNode (
 vx_graph graph,
 vx_image input,
 vx_enum channel,
 vx_image output)
```

[Graph] Creates a channel extract node.

#### Parameters

|     |                |                                                                                                                  |
|-----|----------------|------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>   | The reference to the graph [R00152].                                                                             |
| in  | <i>input</i>   | The input image. Must be one of the defined <a href="#">Image Type Constants</a> multi-channel formats [R00153]. |
| in  | <i>channel</i> | The channel to extract [R00154].                                                                                 |
| out | <i>output</i>  | The output image. Must be <a href="#">VX_DF_IMAGE_U8</a> [R00155].                                               |

Returns

[vx\\_node](#) [R00156].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.16 Color Convert

### 3.16.1 Detailed Description

Implements the Color Conversion Kernel.

This kernel converts an image of a designated [Image Type Constants](#) format to another [Image Type Constants](#) format for those combinations listed in the below table, where the columns are output types and the rows are input types [R00036]. The API version first supporting the conversion is also listed.

| I/O  | RGB | RGBX | NV12 | NV21 | UYVY | YUYV | IYUV | YUV4 |
|------|-----|------|------|------|------|------|------|------|
| RGB  |     | 1.0  | 1.0  |      |      |      | 1.0  | 1.0  |
| RGBX | 1.0 |      | 1.0  |      |      |      | 1.0  | 1.0  |
| NV12 | 1.0 | 1.0  |      |      |      |      | 1.0  | 1.0  |
| NV21 | 1.0 | 1.0  |      |      |      |      | 1.0  | 1.0  |
| UYVY | 1.0 | 1.0  | 1.0  |      |      |      | 1.0  |      |
| YUYV | 1.0 | 1.0  | 1.0  |      |      |      | 1.0  |      |
| IYUV | 1.0 | 1.0  | 1.0  |      |      |      |      | 1.0  |
| YUV4 |     |      |      |      |      |      |      |      |

The [Image Type Constants](#) encoding, held in the [VX\\_IMAGE\\_FORMAT](#) attribute, describes the data layout. The interpretation of the colors is determined by the [VX\\_IMAGE\\_SPACE](#) (see [Image Color Space Constants](#)) and [VX\\_IMAGE\\_RANGE](#) (see [Image Channel Range Constants](#)) attributes of the image [R00037]. OpenVX 1.1 implementations are required only to support images of [VX\\_COLOR\\_SPACE\\_BT709](#) and [VX\\_CHANNEL\\_RANGE\\_FULL](#) [R00038].

If the channel range is defined as [VX\\_CHANNEL\\_RANGE\\_FULL](#), the conversion between the real number and integer quantizations of color channels is defined for red, green, blue, and Y as:

$$value_{real} = \frac{value_{integer}}{256.0}$$

$$value_{integer} = \max(0, \min(255, \text{floor}(value_{real} * 256.0)))$$

For the U and V channels, the conversion between real number and integer quantizations is:

$$value_{real} = \frac{(value_{integer} - 128.0)}{256.0}$$

$$value_{integer} = \max(0, \min(255, \text{floor}((value_{real} * 256.0) + 128)))$$

If the channel range is defined as [VX\\_CHANNEL\\_RANGE\\_RESTRICTED](#), the conversion between the integer quantizations of color channels and the continuous representations is defined for red, green, blue, and Y as:

$$value_{real} = \frac{(value_{integer} - 16.0)}{219.0}$$

$$value_{integer} = \max(0, \min(255, \text{floor}((value_{real} * 219.0) + 16.5)))$$

For the U and V channels, the conversion between real number and integer quantizations is:

$$value_{real} = \frac{(value_{integer} - 128.0)}{224.0}$$

$$value_{integer} = \max(0, \min(255, \text{floor}((value_{real} * 224.0) + 128.5)))$$

The conversions between nonlinear-intensity Y'PbPr and R'G'B' real numbers are:

$$R' = Y' + 2(1 - K_r)Pr$$

$$B' = Y' + 2(1 - K_b)Pb$$

$$G' = Y' - \frac{2(K_r(1 - K_r)Pr + K_b(1 - K_b)Pb)}{1 - K_r - K_b}$$

$$Y' = (K_r * R') + (K_b * B') + (1 - K_r - K_b)G'$$

$$Pb = \frac{B'}{2} - \frac{(R' * K_r) + G'(1 - K_r - K_b)}{2(1 - K_b)}$$

$$Pr = \frac{R'}{2} - \frac{(B' * K_b) + G'(1 - K_r - K_b)}{2(1 - K_r)}$$

The means of reconstructing Pb and Pr values from chroma-downsampled formats is implementation-defined. In [VX\\_COLOR\\_SPACE\\_BT601\\_525](#) or [VX\\_COLOR\\_SPACE\\_BT601\\_625](#):

$$K_r = 0.299$$

$$K_b = 0.114$$

In [VX\\_COLOR\\_SPACE\\_BT709](#) [[R00039](#)]:

$$K_r = 0.2126$$

$$K_b = 0.0722$$

In all cases, for the purposes of conversion, these colour representations are interpreted as nonlinear in intensity, as defined by the BT.601, BT.709, and sRGB specifications. That is, the encoded colour channels are nonlinear R', G' and B', Y', Pb, and Pr.

Each channel of the R'G'B' representation can be converted to and from a linear-intensity RGB channel by these formulae:

$$value_{nonlinear} = 1.099 * value_{linear}^{0.45} - 0.099 \quad for \quad 1 \geq value_{linear} \geq 0.018$$

$$value_{nonlinear} = 4.500 * value_{linear} \quad for \quad 0.018 > value_{linear} \geq 0$$

$$value_{linear} = \left( \frac{value_{nonlinear} + 0.099}{1.099} \right)^{\frac{1}{0.45}} \quad for \quad 1 \geq value_{nonlinear} > 0.081$$

$$value_{linear} = \frac{value_{nonlinear}}{4.5} \quad for \quad 0.081 \geq value_{nonlinear} \geq 0$$

As the different color spaces have different RGB primaries, a conversion between them must transform the color coordinates into the new RGB space. Working with linear RGB values, the conversion formulae are:

$$R_{BT601\_525} = R_{BT601\_625} * 1.112302 + G_{BT601\_625} * -0.102441 + B_{BT601\_625} * -0.009860$$

$$G_{BT601\_525} = R_{BT601\_625} * -0.020497 + G_{BT601\_625} * 1.037030 + B_{BT601\_625} * -0.016533$$

$$B_{BT601\_525} = R_{BT601\_625} * 0.001704 + G_{BT601\_625} * 0.016063 + B_{BT601\_625} * 0.982233$$

$$R_{BT601\_525} = R_{BT709} * 1.065379 + G_{BT709} * -0.055401 + B_{BT709} * -0.009978$$

$$G_{BT601\_525} = R_{BT709} * -0.019633 + G_{BT709} * 1.036363 + B_{BT709} * -0.016731$$

$$B_{BT601\_525} = R_{BT709} * 0.001632 + G_{BT709} * 0.004412 + B_{BT709} * 0.993956$$

$$R_{BT601\_625} = R_{BT601\_525} * 0.900657 + G_{BT601\_525} * 0.088807 + B_{BT601\_525} * 0.010536$$

$$G_{BT601\_625} = R_{BT601\_525} * 0.017772 + G_{BT601\_525} * 0.965793 + B_{BT601\_525} * 0.016435$$

$$B_{BT601\_625} = R_{BT601\_525} * -0.001853 + G_{BT601\_525} * -0.015948 + B_{BT601\_525} * 1.017801$$

$$R_{BT601\_625} = R_{BT709} * 0.957815 + G_{BT709} * 0.042185$$

$$G_{BT601\_625} = G_{BT709}$$

$$B_{BT601\_625} = G_{BT709} * -0.011934 + B_{BT709} * 1.011934$$

$$R_{BT709} = R_{BT601\_525} * 0.939542 + G_{BT601\_525} * 0.050181 + B_{BT601\_525} * 0.010277$$

$$G_{BT709} = R_{BT601\_525} * 0.017772 + G_{BT601\_525} * 0.965793 + B_{BT601\_525} * 0.016435$$

$$B_{BT709} = R_{BT601\_525} * -0.001622 + G_{BT601\_525} * -0.004370 + B_{BT601\_525} * 1.005991$$

$$R_{BT709} = R_{BT601\_625} * 1.044043 + G_{BT601\_625} * -0.044043$$

$$G_{BT709} = G_{BT601\_625}$$

$$B_{BT709} = G_{BT601\_625} * 0.011793 + B_{BT601\_625} * 0.988207$$

A conversion between one YUV color space and another may therefore consist of the following transformations:

1. Convert quantized Y'CbCr ("YUV") to continuous, nonlinear Y'PbPr.
2. Convert continuous Y'PbPr to continuous, nonlinear R'G'B'.
3. Convert nonlinear R'G'B' to linear-intensity RGB (gamma-correction).
4. Convert linear RGB from the first color space to linear RGB in the second color space.
5. Convert linear RGB to nonlinear R'G'B' (gamma-conversion).
6. Convert nonlinear R'G'B' to Y'PbPr.
7. Convert continuous Y'PbPr to quantized Y'CbCr ("YUV").

The above formulae and constants are defined in the ITU [BT.601](#) and [BT.709](#) specifications. The formulae for converting between RGB primaries can be derived from the specified primary chromaticity values and the specified white point by solving for the relative intensity of the primaries.

## Functions

- [vx\\_node VX\\_API\\_CALL vxColorConvertNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_image](#) output)  
[Graph] Creates a color conversion node.

### 3.16.2 Function Documentation

#### vxColorConvertNode()

```
vx_node VX_API_CALL vxColorConvertNode (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a color conversion node.

#### Parameters

|     |               |                                                                   |
|-----|---------------|-------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [ <a href="#">R00148</a> ].            |
| in  | <i>input</i>  | The input image from which to convert [ <a href="#">R00149</a> ]. |
| out | <i>output</i> | The output image to which to convert [ <a href="#">R00150</a> ].  |

## 3.17 Convert Bit depth

### 3.17.1 Detailed Description

Converts image bit depth.

This kernel converts an image from some source bit-depth to another bit-depth as described by the table below [R00040]. If the input value is unsigned the shift must be in zeros [R00041]. If the input value is signed, the shift used must be an arithmetic shift [R00042]. The columns in the table below are the output types and the rows are the input types. The API version on which conversion is supported is also listed. (An X denotes an invalid operation.)

| I/O | U8       | U16 | S16 | U32 | S32 |
|-----|----------|-----|-----|-----|-----|
| U8  | X        |     | 1.0 |     |     |
| U16 |          | X   | X   |     |     |
| S16 | 1.↔<br>0 | X   | X   |     |     |
| U32 |          |     |     | X   | X   |
| S32 |          |     |     | X   | X   |

**Conversion Type** The table below identifies the conversion types for the allowed bith depth conversions.

| From | To  | Conversion Type |
|------|-----|-----------------|
| U8   | S16 | Up-conversion   |
| S16  | U8  | Down-conversion |

**Convert Policy** Down-conversions with `VX_CONVERT_POLICY_WRAP` follow this equation [R00043]:

```
output(x,y) = ((uint8)(input(x,y) >> shift));
```

Down-conversions with `VX_CONVERT_POLICY_SATURATE` follow this equation [R00044]:

```
int16 value = input(x,y) >> shift;
value = value < 0 ? 0 : value;
value = value > 255 ? 255 : value;
output(x,y) = (uint8)value;
```

Up-conversions ignore the policy and perform this operation [R00045]:

```
output(x,y) = ((int16)input(x,y)) << shift;
```

The valid values for 'shift' are as specified below [R00046], all other values produce implementation-dependant behavior.

```
0 <= shift < 8;
```

## Functions

- `vx_node VX_API_CALL vxConvertDepthNode` (`vx_graph` graph, `vx_image` input, `vx_image` output, `vx_enum` policy, `vx_scalar` shift)

[Graph] Creates a bit-depth conversion node.

### 3.17.2 Function Documentation

#### vxConvertDepthNode()

```
vx_node VX_API_CALL vxConvertDepthNode (
 vx_graph graph,
 vx_image input,
 vx_image output,
 vx_enum policy,
 vx_scalar shift)
```

[Graph] Creates a bit-depth conversion node.

**Parameters**

|     |               |                                                                                  |
|-----|---------------|----------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00332].                                             |
| in  | <i>input</i>  | The input image [R00333].                                                        |
| out | <i>output</i> | The output image [R00334].                                                       |
| in  | <i>policy</i> | Use a <a href="#">The Conversion Policy Enumeration</a> . value [R00335].        |
| in  | <i>shift</i>  | A scalar containing a <a href="#">VX_TYPE_INT32</a> of the shift value [R00336]. |

**Returns**

[vx\\_node](#) [R00337].

**Return values**

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.18 Custom Convolution

### 3.18.1 Detailed Description

Convolves the input with the client supplied convolution matrix [R00047].

The client can supply a vx\_int16 typed convolution matrix  $C_{m,n}$ . Outputs will be in the [VX\\_DF\\_IMAGE\\_S16](#) format unless a [VX\\_DF\\_IMAGE\\_U8](#) image is explicitly provided [R00048]. If values would have been out of range of U8 for [VX\\_DF\\_IMAGE\\_U8](#), the values are clamped to 0 or 255 [R00049].

$$k_0 = \frac{m}{2} \quad (3.1)$$

$$l_0 = \frac{n}{2} \quad (3.2)$$

$$sum = \sum_{k=0, l=0}^{k=m-1, l=n-1} input(x+k_0-k, y+l_0-l) C_{k,l} \quad (3.3)$$

Note

The above equation for this function is different than an equivalent operation suggested by the OpenCV Filter2D function.

This translates into the C declaration:

```
// A horizontal Scharr gradient operator with different scale.
vx_int16 gx[3][3] = {
 { 3, 0, -3},
 {10, 0, -10},
 { 3, 0, -3},
};
vx_uint32 scale = 8;
vx_convolution scharr_x = vxCreateConvolution(context, 3, 3);
vxCopyConvolutionCoefficients(scharr_x, (
 vx_int16*)gx, VX_WRITE_ONLY, VX_MEMORY_TYPE_HOST);
vxSetConvolutionAttribute(scharr_x,
 VX_CONVOLUTION_SCALE, &scale, sizeof(scale));
```

For [VX\\_DF\\_IMAGE\\_U8](#) output, an additional step is taken [R00050]:

$$output(x,y) = \begin{cases} 0 & \text{if } sum < 0 \\ 255 & \text{if } sum/scale > 255 \\ sum/scale & \text{otherwise} \end{cases}$$

For [VX\\_DF\\_IMAGE\\_S16](#) output, the summation is simply set to the output [R00051]

$$output(x,y) = sum/scale$$

The overflow policy used is [VX\\_CONVERT\\_POLICY\\_SATURATE](#) [R00052].

## Functions

- [vx\\_node VX\\_API\\_CALL vxConvolveNode](#) (vx\_graph graph, vx\_image input, vx\_convolution conv, vx\_image output)

[Graph] Creates a custom convolution node.

### 3.18.2 Function Documentation

#### vxConvolveNode()

```
vx_node VX_API_CALL vxConvolveNode (
 vx_graph graph,
 vx_image input,
 vx_convolution conv,
 vx_image output)
```

[Graph] Creates a custom convolution node.

**Parameters**

|     |               |                                                                                                        |
|-----|---------------|--------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00247].                                                                   |
| in  | <i>input</i>  | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [R00248].                                     |
| in  | <i>conv</i>   | The <a href="#">vx_int16</a> convolution matrix [R00249].                                              |
| out | <i>output</i> | The output image in <a href="#">VX_DF_IMAGE_U8</a> or <a href="#">VX_DF_IMAGE_S16</a> format [R00250]. |

**Returns**

[vx\\_node](#) [R00251].

**Return values**

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.19 Dilate Image

### 3.19.1 Detailed Description

Implements Dilation, which *grows* the white space in a `VX_DF_IMAGE_U8` Boolean image.

This kernel uses a 3x3 box around the output pixel used to determine value [R00053].

$$dst(x,y) = \max_{\substack{x-1 \leq x' \leq x+1 \\ y-1 \leq y' \leq y+1}} src(x',y')$$

Note

For kernels that use other structuring patterns than 3x3 see `vxNonLinearFilterNode`.

### Functions

- `vx_node VX_API_CALL vxDilate3x3Node (vx_graph graph, vx_image input, vx_image output)`  
[Graph] Creates a Dilation Image Node.

### 3.19.2 Function Documentation

#### `vxDilate3x3Node()`

```
vx_node VX_API_CALL vxDilate3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a Dilation Image Node.

#### Parameters

|     |               |                                                                  |
|-----|---------------|------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00225].                             |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> format [R00226].  |
| out | <i>output</i> | The output image in <code>VX_DF_IMAGE_U8</code> format [R00227]. |

#### Returns

`vx_node` [R00228].

#### Return values

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.20 Equalize Histogram

### 3.20.1 Detailed Description

Equalizes the histogram of a grayscale image.

This kernel uses Histogram Equalization to modify the values of a grayscale image so that it will automatically have a standardized brightness and contrast [R00054].

### Functions

- `vx_node VX_API_CALL vxEqualizeHistNode` (`vx_graph` graph, `vx_image` input, `vx_image` output)  
[Graph] Creates a Histogram Equalization node.

### 3.20.2 Function Documentation

#### vxEqualizeHistNode()

```
vx_node VX_API_CALL vxEqualizeHistNode (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a Histogram Equalization node.

#### Parameters

|     |               |                                                                                                                 |
|-----|---------------|-----------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00198].                                                                            |
| in  | <i>input</i>  | The grayscale input image in <code>VX_DF_IMAGE_U8</code> [R00199].                                              |
| out | <i>output</i> | The grayscale output image of type <code>VX_DF_IMAGE_U8</code> with equalized brightness and contrast [R00200]. |

#### Returns

`vx_node` [R00201].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.21 Erode Image

### 3.21.1 Detailed Description

Implements Erosion, which *shrinks* the white space in a `VX_DF_IMAGE_U8` Boolean image.

This kernel uses a 3x3 box around the output pixel used to determine value [R00055].

$$dst(x,y) = \min_{\substack{x-1 \leq x' \leq x+1 \\ y-1 \leq y' \leq y+1}} src(x',y')$$

Note

For kernels that use other structuring patterns than 3x3 see `vxNonLinearFilterNode`.

### Functions

- `vx_node VX_API_CALL vxErode3x3Node (vx_graph graph, vx_image input, vx_image output)`  
[Graph] Creates an Erosion Image Node.

### 3.21.2 Function Documentation

#### `vxErode3x3Node()`

```
vx_node VX_API_CALL vxErode3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates an Erosion Image Node.

#### Parameters

|     |               |                                                                  |
|-----|---------------|------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00221].                             |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> format [R00222].  |
| out | <i>output</i> | The output image in <code>VX_DF_IMAGE_U8</code> format [R00223]. |

#### Returns

`vx_node` [R00224].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.22 Fast Corners

### 3.22.1 Detailed Description

Computes the corners in an image using a method based upon FAST9 algorithm suggested in [3] and with some updates from [4] with modifications described below [R00056].

It extracts corners by evaluating pixels on the Bresenham circle around a candidate point. If  $N$  contiguous pixels are brighter than the candidate point by at least a threshold value  $t$  or darker by at least  $t$ , then the candidate point is considered to be a corner. For each detected corner, its strength is computed. Optionally, a non-maxima suppression step is applied on all detected corners to remove multiple or spurious responses.

### 3.22.2 Segment Test Detector

The FAST corner detector uses the pixels on a Bresenham circle of radius 3 (16 pixels) to classify whether a candidate point  $p$  is actually a corner, given the following variables.

$I$  = input image (3.4)

$p$  = candidate point position for a corner (3.5)

$I_p$  = image intensity of the candidate point in image  $I$  (3.6)

$x$  = pixel on the Bresenham circle around the candidate point  $p$  (3.7)

$I_x$  = image intensity of the candidate point (3.8)

$t$  = intensity difference threshold for a corner (3.9)

$N$  = minimum number of contiguous pixel to detect a corner (3.10)

$S$  = set of contiguous pixel on the Bresenham circle around the candidate point (3.11)

$C_p$  = corner response at corner location  $p$  (3.12)

(3.13)

The two conditions for FAST corner detection can be expressed as:

- C1: A set of  $N$  contiguous pixels  $S$ ,  $\forall x$  in  $S$ ,  $I_x > I_p + t$
- C2: A set of  $N$  contiguous pixels  $S$ ,  $\forall x$  in  $S$ ,  $I_x < I_p - t$

So when either of these two conditions is met, the candidate  $p$  is classified as a corner.

In this version of the FAST algorithm, the minimum number of contiguous pixels  $N$  is 9 (FAST9).

The value of the intensity difference threshold *strength\_thresh.* of type `VX_TYPE_FLOAT32` must be within:

$$UINT8_{MIN} < t < UINT8_{MAX}$$

These limits are established due to the input data type `VX_DF_IMAGE_U8`.

**Corner Strength Computation** Once a corner has been detected, its strength (response, saliency, or score) shall be computed if `nonmax_suppression` is set to true, otherwise the value of strength is undefined. The corner response  $C_p$  function is defined as the largest threshold  $t$  for which the pixel  $p$  remains a corner.

**Non-maximum suppression** If the `nonmax_suppression` flag is true, a non-maxima suppression step is applied on the detected corners. The corner with coordinates  $(x, y)$  is kept if and only if

$$\begin{aligned} &C_p(x, y) \geq C_p(x-1, y-1) \text{ and } C_p(x, y) \geq C_p(x, y-1) \text{ and} \\ &C_p(x, y) \geq C_p(x+1, y-1) \text{ and } C_p(x, y) \geq C_p(x-1, y) \text{ and} \\ &C_p(x, y) > C_p(x+1, y) \text{ and } C_p(x, y) > C_p(x-1, y+1) \text{ and} \\ &C_p(x, y) > C_p(x, y+1) \text{ and } C_p(x, y) > C_p(x+1, y+1) \end{aligned}$$

## Functions

- `vx_node VX_API_CALL vxFastCornersNode` (`vx_graph` graph, `vx_image` input, `vx_scalar` strength\_thresh, `vx_bool` nonmax\_suppression, `vx_array` corners, `vx_scalar` num\_corners)

*[Graph] Creates a FAST Corners Node.*

### 3.22.3 Function Documentation

#### vxFastCornersNode()

```
vx_node VX_API_CALL vxFastCornersNode (
 vx_graph graph,
 vx_image input,
 vx_scalar strength_thresh,
 vx_bool nonmax_suppression,
 vx_array corners,
 vx_scalar num_corners)
```

*[Graph] Creates a FAST Corners Node.*

#### Parameters

|     |                           |                                                                                                                                                                                                                                                                                                      |
|-----|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>              | The reference to the graph [R00368].                                                                                                                                                                                                                                                                 |
| in  | <i>input</i>              | The input <code>VX_DF_IMAGE_U8</code> image [R00369].                                                                                                                                                                                                                                                |
| in  | <i>strength_thresh</i>    | Threshold on difference between intensity of the central pixel and pixels on Bresenham's circle of radius 3 ( <code>VX_TYPE_FLOAT32</code> scalar), with a value in the range of $0.0 \leq \text{strength\_thresh} < 256.0$ [R00370]. Any fractional value will be truncated to an integer [R00371]. |
| in  | <i>nonmax_suppression</i> | If true, non-maximum suppression is applied to detected corners before being placed in the <code>vx_array</code> of <code>VX_TYPE_KEYPOINT</code> objects [R00372].                                                                                                                                  |
| out | <i>corners</i>            | Output corner <code>vx_array</code> of <code>VX_TYPE_KEYPOINT</code> [R00373]. The order of the keypoints in this array is implementation dependent.                                                                                                                                                 |
| out | <i>num_corners</i>        | The total number of detected corners in image [R00374](optional). Use a <code>VX_TYPE_SIZE</code> scalar [R00375].                                                                                                                                                                                   |

#### Returns

`vx_node` [R00376].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.23 Gaussian Filter

### 3.23.1 Detailed Description

Computes a Gaussian filter over a window of the input image.

This filter uses the following convolution matrix [R00057]:

$$\mathbf{K}_{\text{gaussian}} = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} * \frac{1}{16}$$

### Functions

- `vx_node VX_API_CALL vxGaussian3x3Node (vx_graph graph, vx_image input, vx_image output)`

[Graph] Creates a Gaussian Filter Node.

### 3.23.2 Function Documentation

#### vxGaussian3x3Node()

```
vx_node VX_API_CALL vxGaussian3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a Gaussian Filter Node.

#### Parameters

|     |               |                                                                  |
|-----|---------------|------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00237].                             |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> format [R00238].  |
| out | <i>output</i> | The output image in <code>VX_DF_IMAGE_U8</code> format [R00239]. |

#### Returns

`vx_node` [R00240].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.24 Non Linear Filter

### 3.24.1 Detailed Description

Computes a non-linear filter over a window of the input image.

The attribute [VX\\_CONTEXT\\_NONLINEAR\\_MAX\\_DIMENSION](#) enables the user to query the largest nonlinear filter supported by the implementation of `vxNonLinearFilterNode`. The implementation must support all dimensions (height or width, not necessarily the same) up to the value of this attribute [*R00058*]. The lowest value that must be supported for this attribute is 9 [*R00059*].

### Functions

- `vx_node VX_API_CALL vxNonLinearFilterNode` (`vx_graph` graph, `vx_enum` function, `vx_image` input, `vx_matrix` mask, `vx_image` output)

[Graph] Creates a Non-linear Filter Node.

### 3.24.2 Function Documentation

#### `vxNonLinearFilterNode()`

```
vx_node VX_API_CALL vxNonLinearFilterNode (
 vx_graph graph,
 vx_enum function,
 vx_image input,
 vx_matrix mask,
 vx_image output)
```

[Graph] Creates a Non-linear Filter Node.

#### Parameters

|     |                 |                                                                                                                                                                                                                                             |
|-----|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>    | The reference to the graph [ <i>R00241</i> ].                                                                                                                                                                                               |
| in  | <i>function</i> | The non-linear filter function. Use a <a href="#">Non-linear filter functions</a> value [ <i>R00242</i> ].                                                                                                                                  |
| in  | <i>input</i>    | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [ <i>R00243</i> ].                                                                                                                                                                 |
| in  | <i>mask</i>     | The mask to be applied to the Non-linear function [ <i>R00244</i> ]. <a href="#">VX_MATRIX_ORIGIN</a> attribute is used to place the mask appropriately when computing the resulting image. See <a href="#">vxCreateMatrixFromPattern</a> . |
| out | <i>output</i>   | The output image in <a href="#">VX_DF_IMAGE_U8</a> format [ <i>R00245</i> ].                                                                                                                                                                |

#### Returns

`vx_node` [*R00246*].

#### Return values

|                      |                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.25 Harris Corners

### 3.25.1 Detailed Description

Computes the Harris Corners of an image.

The Harris Corners are computed with several parameters

$$I = \text{input image} \quad (3.14)$$

$$T_c = \text{corner strength threshold} \quad (3.15)$$

$$r = \text{euclidean radius} \quad (3.16)$$

$$k = \text{sensitivity threshold} \quad (3.17)$$

$$w = \text{window size} \quad (3.18)$$

$$b = \text{block size} \quad (3.19)$$

$$(3.20)$$

The computation to find the corner values or scores can be summarized as [R00060]:

$$G_x = \text{Sobel}_x(w, I) \quad (3.21)$$

$$G_y = \text{Sobel}_y(w, I) \quad (3.22)$$

$$A = \text{window}_{G_{x,y}}(x - b/2, y - b/2, x + b/2, y + b/2) \quad (3.23)$$

$$\text{trace}(A) = \sum_x^A G_x^2 + \sum_y^A G_y^2 \quad (3.24)$$

$$\det(A) = \sum_x^A G_x^2 \sum_y^A G_y^2 - \left( \sum_x^A (G_x G_y) \right)^2 \quad (3.25)$$

$$M_c(x, y) = \det(A) - k * \text{trace}(A)^2 \quad (3.26)$$

$$V_c(x, y) = \begin{cases} M_c(x, y) & \text{if } M_c(x, y) > T_c \\ 0 & \text{otherwise} \end{cases} \quad (3.27)$$

where  $V_c$  is the thresholded corner value.

The normalized Sobel kernels used for the gradient computation shall be as shown below:

- For gradient size 3 [R00061]:

$$\text{Sobel}_x(\text{Normalized}) = \frac{1}{4 * 255 * b} * \begin{vmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{vmatrix}$$

$$\text{Sobel}_y(\text{Normalized}) = \frac{1}{4 * 255 * b} * \text{transpose}(\text{sobel}_x) = \frac{1}{4 * 255 * b} * \begin{vmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{vmatrix}$$

- For gradient size 5 [R00062]:

$$\text{Sobel}_x(\text{Normalized}) = \frac{1}{16 * 255 * b} * \begin{vmatrix} -1 & -2 & 0 & 2 & 1 \\ -4 & -8 & 0 & 8 & 4 \\ -6 & -12 & 0 & 12 & 6 \\ -4 & -8 & 0 & 8 & 4 \\ -1 & -2 & 0 & 2 & 1 \end{vmatrix}$$

$$\text{Sobel}_y(\text{Normalized}) = \frac{1}{16 * 255 * b} * \text{transpose}(\text{sobel}_x)$$

- For gradient size 7 [R00063]:

$$\text{Sobel}_x(\text{Normalized}) = \frac{1}{64 * 255 * b} * \begin{vmatrix} -1 & -4 & -5 & 0 & 5 & 4 & 1 \\ -6 & -24 & -30 & 0 & 30 & 24 & 6 \\ -15 & -60 & -75 & 0 & 75 & 60 & 15 \\ -20 & -80 & -100 & 0 & 100 & 80 & 20 \\ -15 & -60 & -75 & 0 & 75 & 60 & 15 \\ -6 & -24 & -30 & 0 & 30 & 24 & 6 \\ -1 & -4 & -5 & 0 & 5 & 4 & 1 \end{vmatrix}$$

$$\text{Sobel}_y(\text{Normalized}) = \frac{1}{64 * 255 * b} * \text{transpose}(\text{sobel}_x)$$

$V_c$  is then non-maximally suppressed, returning the same results as using the following algorithm [R00064]:

- Filter the features using the non-maximum suppression algorithm defined for `vxFastCornersNode`.
- Create an array of features sorted by  $V_c$  in descending order:  $V_c(j) > V_c(j+1)$ .
- Initialize an empty feature set  $F = \{\}$
- For each feature  $j$  in the sorted array, while  $V_c(j) > T_c$ :
  - If there is no feature  $i$  in  $F$  such that the Euclidean distance between pixels  $i$  and  $j$  is less than  $r$ , add the feature  $j$  to the feature set  $F$ .

An implementation shall support all values of Euclidean distance  $r$  that satisfy [R00065]:

```
0 <= max_dist <= 30
```

The feature set  $F$  is returned as a `vx_array` of `vx_keypoint_t` structs.

## Functions

- `vx_node VX_API_CALL vxHarrisCornersNode` (`vx_graph` graph, `vx_image` input, `vx_scalar` strength\_thresh, `vx_scalar` min\_distance, `vx_scalar` sensitivity, `vx_int32` gradient\_size, `vx_int32` block\_size, `vx_array` corners, `vx_scalar` num\_corners)

[Graph] Creates a Harris Corners Node.

### 3.25.2 Function Documentation

#### `vxHarrisCornersNode()`

```
vx_node VX_API_CALL vxHarrisCornersNode (
 vx_graph graph,
 vx_image input,
 vx_scalar strength_thresh,
 vx_scalar min_distance,
 vx_scalar sensitivity,
 vx_int32 gradient_size,
 vx_int32 block_size,
 vx_array corners,
 vx_scalar num_corners)
```

[Graph] Creates a Harris Corners Node.

#### Parameters

|    |                        |                                                                                                                                                        |
|----|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>graph</i>           | The reference to the graph [R00357].                                                                                                                   |
| in | <i>input</i>           | The input <code>VX_DF_IMAGE_U8</code> image [R00358].                                                                                                  |
| in | <i>strength_thresh</i> | The <code>VX_TYPE_FLOAT32</code> minimum threshold with which to eliminate Harris Corner scores (computed using the normalized Sobel kernel) [R00359]. |
| in | <i>min_distance</i>    | The <code>VX_TYPE_FLOAT32</code> radial Euclidean distance for non-maximum suppression [R00360].                                                       |
| in | <i>sensitivity</i>     | The <code>VX_TYPE_FLOAT32</code> scalar sensitivity threshold $k$ from the Harris-Stephens equation [R00361].                                          |
| in | <i>gradient_size</i>   | The gradient window size to use on the input [R00362]. The implementation must support at least 3, 5, and 7.                                           |
| in | <i>block_size</i>      | The block window size used to compute the Harris Corner score [R00363]. The implementation must support at least 3, 5, and 7.                          |

**Parameters**

|     |                    |                                                                                                                                       |
|-----|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| out | <i>corners</i>     | The array of <a href="#">VX_TYPE_KEYPOINT</a> objects [R00364]. The order of the keypoints in this array is implementation dependent. |
| out | <i>num_corners</i> | The total number of detected corners in image [R00365](optional). Use a <a href="#">VX_TYPE_SIZE</a> scalar [R00366].                 |

**Returns**

[vx\\_node](#) [R00367].

**Return values**

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.26 Histogram

### 3.26.1 Detailed Description

Generates a distribution from an image.

This kernel counts the number of occurrences of each pixel value within the window size of a pre-calculated number of bins. A pixel with intensity 'I' will result in incrementing histogram bin 'i' where [R00066]

$$i = (I - offset) * numBins / range \text{ for } I \geq offset$$

and

$$I < offset + range.$$

Pixels with intensities that don't meet these conditions will have no effect on the histogram [R00067]. Here offset, range and numBins are values of histogram attributes (see [VX\\_DISTRIBUTION\\_OFFSET](#), [VX\\_DISTRIBUTION\\_RANGE](#), [VX\\_DISTRIBUTION\\_BINS](#)).

### Functions

- [vx\\_node VX\\_API\\_CALL vxHistogramNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_distribution](#) distribution)

[Graph] Creates a Histogram node.

### 3.26.2 Function Documentation

#### vxHistogramNode()

```
vx_node VX_API_CALL vxHistogramNode (
 vx_graph graph,
 vx_image input,
 vx_distribution distribution)
```

[Graph] Creates a Histogram node.

#### Parameters

|     |                     |                                                             |
|-----|---------------------|-------------------------------------------------------------|
| in  | <i>graph</i>        | The reference to the graph [R00194].                        |
| in  | <i>input</i>        | The input image in <a href="#">VX_DF_IMAGE_U8</a> [R00195]. |
| out | <i>distribution</i> | The output distribution [R00196].                           |

#### Returns

[vx\\_node](#) [R00197].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.27 Gaussian Image Pyramid

### 3.27.1 Detailed Description

Computes a Gaussian Image Pyramid from an input image.

This vision function creates the Gaussian image pyramid from the input image using the particular 5x5 Gaussian Kernel [R00068]:

$$\mathbf{G} = \frac{1}{256} * \begin{bmatrix} 1 & 4 & 6 & 4 & 1 \\ 4 & 16 & 24 & 16 & 4 \\ 6 & 24 & 36 & 24 & 6 \\ 4 & 16 & 24 & 16 & 4 \\ 1 & 4 & 6 & 4 & 1 \end{bmatrix}$$

on each level of the pyramid then scales the image to the next level using [VX\\_INTERPOLATION\\_NEAREST\\_NEIGHBOR](#) [R00069]. For the Gaussian pyramid, level 0 shall always have the same resolution and contents as the input image [R00070]. Pyramids configured with one of the following level scaling must be supported [R00071]:

- [VX\\_SCALE\\_PYRAMID\\_HALF](#)
- [VX\\_SCALE\\_PYRAMID\\_ORB](#)

### Functions

- [vx\\_node VX\\_API\\_CALL vxGaussianPyramidNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_pyramid](#) gaussian)

[Graph] Creates a node for a Gaussian Image Pyramid.

### 3.27.2 Function Documentation

#### vxGaussianPyramidNode()

```
vx_node VX_API_CALL vxGaussianPyramidNode (
 vx_graph graph,
 vx_image input,
 vx_pyramid gaussian)
```

[Graph] Creates a node for a Gaussian Image Pyramid.

#### Parameters

|     |                 |                                                                                 |
|-----|-----------------|---------------------------------------------------------------------------------|
| in  | <i>graph</i>    | The reference to the graph [R00252].                                            |
| in  | <i>input</i>    | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [R00253].              |
| out | <i>gaussian</i> | The Gaussian pyramid with <a href="#">VX_DF_IMAGE_U8</a> to construct [R00254]. |

[Object: Pyramid](#)

Returns

[vx\\_node](#) [R00255].

#### Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.28 Laplacian Image Pyramid

### 3.28.1 Detailed Description

Computes a Laplacian Image Pyramid from an input image.

This vision function creates the Laplacian image pyramid from the input image. First, a Gaussian pyramid with [VX\\_SCALE\\_PYRAMID\\_HALF](#) is created [R00072]. Then, for each level  $i$ , the corresponding image  $I_i$  is blurred with Gaussian 5x5 filter, and the difference between the two images is the corresponding level  $L_i$  of the Laplacian pyramid [R00073]:

$$L_i = I_i - \text{Gaussian5x5}(I_i).$$

Level 0 shall always have the same resolution as the input image [R00074].

### Functions

- [vx\\_node VX\\_API\\_CALL vxLaplacianPyramidNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_pyramid](#) laplacian, [vx\\_image](#) output)

[Graph] Creates a node for a Laplacian Image Pyramid.

### 3.28.2 Function Documentation

#### vxLaplacianPyramidNode()

```
vx_node VX_API_CALL vxLaplacianPyramidNode (
 vx_graph graph,
 vx_image input,
 vx_pyramid laplacian,
 vx_image output)
```

[Graph] Creates a node for a Laplacian Image Pyramid.

#### Parameters

|     |                  |                                                                                                                                         |
|-----|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>     | The reference to the graph [R00256].                                                                                                    |
| in  | <i>input</i>     | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [R00257].                                                                      |
| out | <i>laplacian</i> | The Laplacian pyramid with <a href="#">VX_DF_IMAGE_S16</a> to construct [R00258].                                                       |
| out | <i>output</i>    | The lowest resolution image of type <a href="#">VX_DF_IMAGE_S16</a> necessary to reconstruct the input image from the pyramid [R00259]. |

See also

[Object: Pyramid](#)

Returns

[vx\\_node](#) [R00260].

#### Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.29 Reconstruction from a Laplacian Image Pyramid

### 3.29.1 Detailed Description

Reconstructs the original image from a Laplacian Image Pyramid.

This vision function reconstructs the image of the highest possible resolution from a Laplacian pyramid. The input image is added to the last level of the Laplacian pyramid  $L_{n-2}$ , the resulting image is upsampled to the resolution of the next pyramid level:

$$I_{n-2} = \text{upsample}(\text{input} + L_{n-1})$$

Correspondingly, for each pyramid level  $i$ , except for the first  $i = 0$  and the last  $i = n - 1$ :

$$I_{i-1} = \text{upsample}(I_i + L_i)$$

Finally, the output image is [R00075]:

$$\text{out put} = I_0 + L_0$$

### Functions

- `vx_node VX_API_CALL vxLaplacianReconstructNode` (`vx_graph` graph, `vx_pyramid` laplacian, `vx_image` input, `vx_image` output)

[Graph] Reconstructs an image from a Laplacian Image pyramid.

### 3.29.2 Function Documentation

#### vxLaplacianReconstructNode()

```
vx_node VX_API_CALL vxLaplacianReconstructNode (
 vx_graph graph,
 vx_pyramid laplacian,
 vx_image input,
 vx_image output)
```

[Graph] Reconstructs an image from a Laplacian Image pyramid.

#### Parameters

|     |                  |                                                                                                                                              |
|-----|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>     | The reference to the graph [R00261].                                                                                                         |
| in  | <i>laplacian</i> | The Laplacian pyramid with <code>VX_DF_IMAGE_S16</code> format [R00262].                                                                     |
| in  | <i>input</i>     | The lowest resolution image of type <code>VX_DF_IMAGE_S16</code> for the Laplacian pyramid [R00263]                                          |
| out | <i>output</i>    | The output image of type <code>VX_DF_IMAGE_U8</code> with the highest possible resolution reconstructed from the Laplacian pyramid [R00264]. |

[Object: Pyramid](#)

Returns

`vx_node` [R00265].

#### Return values

|   |                            |
|---|----------------------------|
| 0 | Node could not be created. |
| * | Node handle.               |

## 3.30 Integral Image

### 3.30.1 Detailed Description

Computes the integral image of the input.

Each output pixel is the sum of the corresponding input pixel and all other pixels above and to the left of it [R00076].

$$dst(x,y) = sum(x,y)$$

where, for  $x \geq 0$  and  $y \geq 0$

$$sum(x,y) = src(x,y) + sum(x-1,y) + sum(x,y-1) - sum(x-1,y-1)$$

otherwise,

$$sum(x,y) = 0$$

The overflow policy used is `VX_CONVERT_POLICY_WRAP` [R00077].

### Functions

- `vx_node VX_API_CALL vxIntegralImageNode (vx_graph graph, vx_image input, vx_image output)`  
[Graph] Creates an Integral Image Node.

### 3.30.2 Function Documentation

#### `vxIntegralImageNode()`

```
vx_node VX_API_CALL vxIntegralImageNode (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates an Integral Image Node.

#### Parameters

|     |               |                                                                   |
|-----|---------------|-------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00217].                              |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> format [R00218].   |
| out | <i>output</i> | The output image in <code>VX_DF_IMAGE_U32</code> format [R00219]. |

#### Returns

`vx_node` [R00220].

#### Return values

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.31 Magnitude

### 3.31.1 Detailed Description

Implements the Gradient Magnitude Computation Kernel.

This kernel takes two gradients in [VX\\_DF\\_IMAGE\\_S16](#) format and computes the [VX\\_DF\\_IMAGE\\_S16](#) normalized magnitude [*R00078*]. Magnitude is computed as [*R00079*]:

$$mag(x,y) = \sqrt{grad_x(x,y)^2 + grad_y(x,y)^2}$$

The conceptual definition describing the overflow is given as [*R00080*]:

```
uint16 z = uint16(sqrt(double(uint32(int32(x) * int32(x)) + uint32(int32(y) * int32(y)))) + 0.5);
int16 mag = z > 32767 ? 32767 : z;
```

### Functions

- [vx\\_node VX\\_API\\_CALL vxMagnitudeNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) grad\_x, [vx\\_image](#) grad\_y, [vx\\_image](#) mag)

[Graph] Create a Magnitude node.

### 3.31.2 Function Documentation

#### vxMagnitudeNode()

```
vx_node VX_API_CALL vxMagnitudeNode (
 vx_graph graph,
 vx_image grad_x,
 vx_image grad_y,
 vx_image mag)
```

[Graph] Create a Magnitude node.

#### Parameters

|     |                         |                                                                                              |
|-----|-------------------------|----------------------------------------------------------------------------------------------|
| in  | <i>graph</i>            | The reference to the graph [ <i>R00178</i> ].                                                |
| in  | <i>grad<sub>x</sub></i> | The input x image. This must be in <a href="#">VX_DF_IMAGE_S16</a> format [ <i>R00179</i> ]. |
| in  | <i>grad<sub>y</sub></i> | The input y image. This must be in <a href="#">VX_DF_IMAGE_S16</a> format [ <i>R00180</i> ]. |
| out | <i>mag</i>              | The magnitude image. This is in <a href="#">VX_DF_IMAGE_S16</a> format [ <i>R00181</i> ].    |

Returns

[vx\\_node](#) [*R00182*].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.32 Mean and Standard Deviation

### 3.32.1 Detailed Description

Computes the mean pixel value and the standard deviation of the pixels in the input image (which has a dimension width and height).

The mean value is computed as [R00081]:

$$\mu = \frac{\left( \sum_{y=0}^h \sum_{x=0}^w src(x,y) \right)}{(width * height)}$$

The standard deviation is computed as [R00082]:

$$\sigma = \sqrt{\frac{\left( \sum_{y=0}^h \sum_{x=0}^w (\mu - src(x,y))^2 \right)}{(width * height)}}$$

### Functions

- `vx_node VX_API_CALL vxMeanStdDevNode (vx_graph graph, vx_image input, vx_scalar mean, vx_scalar stddev)`

[Graph] Creates a mean value and standard deviation node.

### 3.32.2 Function Documentation

#### vxMeanStdDevNode()

```
vx_node VX_API_CALL vxMeanStdDevNode (
 vx_graph graph,
 vx_image input,
 vx_scalar mean,
 vx_scalar stddev)
```

[Graph] Creates a mean value and standard deviation node.

#### Parameters

|     |               |                                                                                   |
|-----|---------------|-----------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00207].                                              |
| in  | <i>input</i>  | The input image. <code>VX_DF_IMAGE_U8</code> is supported [R00208].               |
| out | <i>mean</i>   | The <code>VX_TYPE_FLOAT32</code> average pixel value [R00209].                    |
| out | <i>stddev</i> | The <code>VX_TYPE_FLOAT32</code> standard deviation of the pixel values [R00210]. |

#### Returns

`vx_node` [R00211].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.33 Median Filter

### 3.33.1 Detailed Description

Computes a median pixel value over a window of the input image [R00083].

The median is the middle value over an odd-numbered, sorted range of values.

Note

For kernels that use other structuring patterns than 3x3 see [vxNonLinearFilterNode](#).

### Functions

- [vx\\_node VX\\_API\\_CALL vxMedian3x3Node](#) ([vx\\_graph](#) graph, [vx\\_image](#) input, [vx\\_image](#) output)  
[Graph] Creates a Median Image Node.

### 3.33.2 Function Documentation

#### **vxMedian3x3Node()**

```
vx_node VX_API_CALL vxMedian3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output)
```

[Graph] Creates a Median Image Node.

#### Parameters

|     |               |                                                                     |
|-----|---------------|---------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00229].                                |
| in  | <i>input</i>  | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [R00230].  |
| out | <i>output</i> | The output image in <a href="#">VX_DF_IMAGE_U8</a> format [R00231]. |

#### Returns

[vx\\_node](#) [R00232].

#### Return values

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

### 3.34 Min, Max Location

#### 3.34.1 Detailed Description

Finds the minimum and maximum values in an image and a location for each [R00084].

If the input image has several minimums/maximums, the kernel returns all of them [R00085].

$$\begin{aligned} \minVal = & \min_{\substack{0 \leq x' \leq width \\ 0 \leq y' \leq height}} src(x', y') \end{aligned}$$

$$\begin{aligned} \maxVal = & \max_{\substack{0 \leq x' \leq width \\ 0 \leq y' \leq height}} src(x', y') \end{aligned}$$

#### Functions

- `vx_node VX_API_CALL vxMinMaxLocNode (vx_graph graph, vx_image input, vx_scalar minVal, vx_scalar maxVal, vx_array minLoc, vx_array maxLoc, vx_scalar minCount, vx_scalar maxCount)`

[Graph] Creates a min,max,loc node.

#### 3.34.2 Function Documentation

##### vxMinMaxLocNode()

```
vx_node VX_API_CALL vxMinMaxLocNode (
 vx_graph graph,
 vx_image input,
 vx_scalar minVal,
 vx_scalar maxVal,
 vx_array minLoc,
 vx_array maxLoc,
 vx_scalar minCount,
 vx_scalar maxCount)
```

[Graph] Creates a min,max,loc node.

##### Parameters

|     |                 |                                                                                                                                                                                                 |
|-----|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>    | The reference to create the graph [R00279].                                                                                                                                                     |
| in  | <i>input</i>    | The input image in <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> format [R00280].                                                                                                 |
| out | <i>minVal</i>   | The minimum value in the image, which corresponds to the type of the input [R00281].                                                                                                            |
| out | <i>maxVal</i>   | The maximum value in the image, which corresponds to the type of the input [R00282].                                                                                                            |
| out | <i>minLoc</i>   | The minimum <code>VX_TYPE_COORDINATES2D</code> locations [R00283](optional) [R00284]. If the input image has several minimums, the kernel will return up to the capacity of the array [R00285]. |
| out | <i>maxLoc</i>   | The maximum <code>VX_TYPE_COORDINATES2D</code> locations [R00286](optional) [R00287]. If the input image has several maximums, the kernel will return up to the capacity of the array [R00288]. |
| out | <i>minCount</i> | The total number of detected minimums in image [R00289](optional). Use a <code>VX_TYPE_UINT32</code> scalar [R00290].                                                                           |
| out | <i>maxCount</i> | The total number of detected maximums in image [R00291](optional). Use a <code>VX_TYPE_UINT32</code> scalar [R00292].                                                                           |

**Returns**

[vx\\_node](#).

**Return values**

## 3.35 Optical Flow Pyramid (LK)

### 3.35.1 Detailed Description

Computes the optical flow using the Lucas-Kanade method between two pyramid images.

The function is an implementation of the algorithm described in [1] [R00086]. The function inputs are two `vx_pyramid` objects, old and new, along with a `vx_array` of `vx_keypoint_t` structs to track from the old `vx_pyramid`. Both pyramids old and new pyramids must have the same dimensionality [R00087]. `VX_SCALE_PYRAMID_HALF` pyramidal scaling must be supported [R00088].

The function outputs a `vx_array` of `vx_keypoint_t` structs that were tracked from the old `vx_pyramid` to the new `vx_pyramid` [R00089]. Each element in the `vx_array` of `vx_keypoint_t` structs in the new array may be valid or not [R00090]. The implementation shall return the same number of `vx_keypoint_t` structs in the new `vx_array` that were in the older `vx_array` [R00091].

In more detail: The Lucas-Kanade method finds the affine motion vector  $V$  for each point in the old image tracking points array, using the following equation:

$$\begin{bmatrix} V_x \\ V_y \end{bmatrix} = \begin{bmatrix} \sum_i I_x^2 & \sum_i I_x * I_y \\ \sum_i I_x * I_y & \sum_i I_y^2 \end{bmatrix}^{-1} \begin{bmatrix} -\sum_i I_x * I_t \\ -\sum_i I_y * I_t \end{bmatrix}$$

Where  $I_x$  and  $I_y$  are obtained using the Scharr gradients on the input image:

$$G_x = \begin{bmatrix} +3 & 0 & -3 \\ +10 & 0 & -10 \\ +3 & 0 & -3 \end{bmatrix}$$

$$G_y = \begin{bmatrix} +3 & +10 & +3 \\ 0 & 0 & 0 \\ -3 & -10 & -3 \end{bmatrix}$$

$I_t$  is obtained by a simple difference between the same pixel in both images.  $I$  is defined as the adjacent pixels to the point  $p(x,y)$  under consideration. With a given window size of  $M$ ,  $I$  is  $M^2$  points. The pixel  $p(x,y)$  is centered in the window. In practice, to get an accurate solution, it is necessary to iterate multiple times on this scheme (in a Newton-Raphson fashion) until:

- the residual of the affine motion vector is smaller than a threshold
- And/or maximum number of iteration achieved. Each iteration, the estimation of the previous iteration is used by changing  $I_t$  to be the difference between the old image and the pixel with the estimated coordinates in the new image. Each iteration the function checks if the pixel to track was lost. The criteria for lost tracking is that the matrix above is invertible. (The determinant of the matrix is less than a threshold :  $10^{-7}$  .) Or the minimum eigenvalue of the matrix is smaller then a threshold (  $10^{-4}$  ). Also lost tracking happens when the point tracked coordinate is outside the image coordinates. When `vx_true_e` is given as the input to `use_initial_estimates`, the algorithm starts by calculating  $I_t$  as the difference between the old image and the pixel with the initial estimated coordinates in the new image [R00092]. The input `vx_array` of `vx_keypoint_t` structs with `tracking_status` set to zero (lost) are copied to the new `vx_array` [R00093].

Clients are responsible for editing the output `vx_array` of `vx_keypoint_t` structs array before applying it as the input `vx_array` of `vx_keypoint_t` structs for the next frame. For example, `vx_keypoint_t` structs with `tracking_status` set to zero may be removed by a client for efficiency.

This function changes just the  $x$ ,  $y$ , and `tracking_status` members of the `vx_keypoint_t` structure and behaves as if it copied the rest from the old tracking `vx_keypoint_t` to new image `vx_keypoint_t` [R00094].

## Functions

- `vx_node VX_API_CALL vxOpticalFlowPyrLKNode` (`vx_graph` graph, `vx_pyramid` old\_images, `vx_pyramid` new\_images, `vx_array` old\_points, `vx_array` new\_points\_estimates, `vx_array` new\_points, `vx_enum` termination, `vx_scalar` epsilon, `vx_scalar` num\_iterations, `vx_scalar` use\_initial\_estimate, `vx_size` window\_dimension)

[Graph] Creates a Lucas Kanade Tracking Node.

### 3.35.2 Function Documentation

#### vxOpticalFlowPyrLKNode()

```
vx_node VX_API_CALL vxOpticalFlowPyrLKNode (
 vx_graph graph,
 vx_pyramid old_images,
 vx_pyramid new_images,
 vx_array old_points,
 vx_array new_points_estimates,
 vx_array new_points,
 vx_enum termination,
 vx_scalar epsilon,
 vx_scalar num_iterations,
 vx_scalar use_initial_estimate,
 vx_size window_dimension)
```

[Graph] Creates a Lucas Kanade Tracking Node.

#### Parameters

|     |                             |                                                                                                                                                                                                                   |

## 3.36 Phase

### 3.36.1 Detailed Description

Implements the Gradient Phase Computation Kernel.

This kernel takes two gradients in [VX\\_DF\\_IMAGE\\_S16](#) format and computes the angles for each pixel and stores this in a [VX\\_DF\\_IMAGE\\_U8](#) image [[R00095](#)].

$$\phi = \tan^{-1} \frac{\text{grad}_y(x,y)}{\text{grad}_x(x,y)}$$

Where  $\phi$  is then translated to  $0 \leq \phi < 2\pi$ . Each  $\phi$  value is then mapped to the range 0 to 255 inclusive [[R00096](#)].

### Functions

- [vx\\_node VX\\_API\\_CALL vxPhaseNode](#) ([vx\\_graph](#) graph, [vx\\_image](#) grad\_x, [vx\\_image](#) grad\_y, [vx\\_image](#) orientation)

[Graph] Creates a Phase node.

### 3.36.2 Function Documentation

#### vxPhaseNode()

```
vx_node VX_API_CALL vxPhaseNode (
 vx_graph graph,
 vx_image grad_x,
 vx_image grad_y,
 vx_image orientation)
```

[Graph] Creates a Phase node.

#### Parameters

|     |                    |                                                                                                       |
|-----|--------------------|-------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>       | The reference to the graph [ <a href="#">R00166</a> ].                                                |
| in  | <i>grad_x</i>      | The input x image. This must be in <a href="#">VX_DF_IMAGE_S16</a> format [ <a href="#">R00167</a> ]. |
| in  | <i>grad_y</i>      | The input y image. This must be in <a href="#">VX_DF_IMAGE_S16</a> format [ <a href="#">R00168</a> ]. |
| out | <i>orientation</i> | The phase image. This is in <a href="#">VX_DF_IMAGE_U8</a> format [ <a href="#">R00169</a> ].         |

| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.37 Pixel-wise Multiplication

### 3.37.1 Detailed Description

Performs element-wise multiplication between two images and a scalar value.

Pixel-wise multiplication is performed between the pixel values in two `VX_DF_IMAGE_U8` or `VX_DF_IMAGE_S16` images and a scalar floating-point number *scale* [R00097]. The output image can be `VX_DF_IMAGE_U8` only if both source images are `VX_DF_IMAGE_U8` and the output image is explicitly set to `VX_DF_IMAGE_U8` [R00098]. It is otherwise `VX_DF_IMAGE_S16` [R00099]. If one of the input images is of type `VX_DF_IMAGE_S16`, all values are converted to `VX_DF_IMAGE_S16` [R00100].

The scale with a value of  $1/2^n$ , where  $n$  is an integer and  $0 \leq n \leq 15$ , and 1/255 (0x1.010102p-8 C99 float hex) must be supported [R00101]. The support for other values of scale is not prohibited. Furthermore, for scale with a value of 1/255 the rounding policy of `VX_ROUND_POLICY_TO_NEAREST_EVEN` must be supported [R00102]. For the scale with value of  $1/2^n$  the rounding policy of `VX_ROUND_POLICY_TO_ZERO` must be supported [R00103]. The support of other rounding modes for any values of scale is not prohibited.

The rounding policy `VX_ROUND_POLICY_TO_ZERO` for this function is defined as [R00104]:

$$reference(x,y,scale) = truncate(((int32_t)in_1(x,y)) * ((int32_t)in_2(x,y)) * (double)scale)$$

The rounding policy `VX_ROUND_POLICY_TO_NEAREST_EVEN` for this function is defined as [R00105]:

$$reference(x,y,scale) = round\_to\_nearest\_even(((int32_t)in_1(x,y)) * ((int32_t)in_2(x,y)) * (double)scale)$$

The overflow handling is controlled by an overflow-policy parameter [R00106]. For each pixel value in the two input images:

$$out(x,y) = in_1(x,y) * in_2(x,y) * scale$$

### Functions

- `vx_node VX_API_CALL vxMultiplyNode (vx_graph graph, vx_image in1, vx_image in2, vx_scalar scale, vx_enum overflow_policy, vx_enum rounding_policy, vx_image out)`

[Graph] Creates an pixelwise-multiplication node.

### 3.37.2 Function Documentation

#### vxMultiplyNode()

```
vx_node VX_API_CALL vxMultiplyNode (
 vx_graph graph,
 vx_image in1,
 vx_image in2,
 vx_scalar scale,
 vx_enum overflow_policy,
 vx_enum rounding_policy,
 vx_image out)
```

[Graph] Creates an pixelwise-multiplication node.

#### Parameters

|     |                        |                                                                                                           |
|-----|------------------------|-----------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>           | The reference to the graph [R00312].                                                                      |
| in  | <i>in1</i>             | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> [R00313].                     |
| in  | <i>in2</i>             | An input image, <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> [R00314].                     |
| in  | <i>scale</i>           | A non-negative <code>VX_TYPE_FLOAT32</code> multiplied to each product before overflow handling [R00315]. |
| in  | <i>overflow_policy</i> | Use a <a href="#">The Conversion Policy Enumeration</a> . value [R00316].                                 |
| in  | <i>rounding_policy</i> | Use a <a href="#">The Round Policy Enumeration</a> . value [R00317].                                      |
| out | <i>out</i>             | The output image, a <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> image [R00318].           |

## Returns

[vx\\_node](#) [R00319].

## Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.38 Remap

### 3.38.1 Detailed Description

Maps output pixels in an image from input pixels in an image.

Remap takes a remap table object `vx_remap` to map a set of output pixels back to source input pixels [R00107]. A remap is typically defined as:

$$out\_put(x,y) = input(mapx(x,y),mapy(x,y));$$

for every (x,y) in the destination image

However, the mapping functions are contained in the `vx_remap` object.

### Functions

- `vx_node VX_API_CALL vxRemapNode (vx_graph graph, vx_image input, vx_remap table, vx_enum policy, vx_image output)`

[Graph] Creates a Remap Node.

### 3.38.2 Function Documentation

#### vxRemapNode()

```
vx_node VX_API_CALL vxRemapNode (
 vx_graph graph,
 vx_image input,
 vx_remap table,
 vx_enum policy,
 vx_image output)
```

[Graph] Creates a Remap Node.

#### Parameters

|     |               |                                                                                                                                    |
|-----|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph that will contain the node [R00389].                                                                    |
| in  | <i>input</i>  | The input <code>VX_DF_IMAGE_U8</code> image [R00390].                                                                              |
| in  | <i>table</i>  | The remap table object [R00391].                                                                                                   |
| in  | <i>policy</i> | An interpolation type from <a href="#">Interpolation Constants</a> . <code>VX_INTERPOLATION_AREA</code> is not supported [R00392]. |
| out | <i>output</i> | The output <code>VX_DF_IMAGE_U8</code> image [R00393].                                                                             |

#### Note

The border modes `VX_NODE_BORDER` value `VX_BORDER_UNDEFINED` and `VX_BORDER_CONSTANT` are supported.

#### Returns

A `vx_node` [R00394].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.39 Scale Image

### 3.39.1 Detailed Description

Implements the Image Resizing Kernel.

This kernel resizes an image from the source to the destination dimensions. The supported interpolation types are currently:

- [VX\\_INTERPOLATION\\_NEAREST\\_NEIGHBOR](#) [R00108]
- [VX\\_INTERPOLATION\\_AREA](#) [R00109]
- [VX\\_INTERPOLATION\\_BILINEAR](#) [R00110]

The sample positions used to determine output pixel values are generated by scaling the outside edges of the source image pixels to the outside edges of the destination image pixels. As described in the documentation for [Interpolation Constants](#), samples are taken at pixel centers. This means that, unless the scale is 1:1, the sample position for the top left destination pixel typically does not fall exactly on the top left source pixel but will be generated by interpolation.

That is, the sample positions corresponding in source and destination are defined by the following equations:

$$x_{input} = \left( (x_{output} + 0.5) * \frac{width_{input}}{width_{output}} \right) - 0.5$$

$$y_{input} = \left( (y_{output} + 0.5) * \frac{height_{input}}{height_{output}} \right) - 0.5$$

$$x_{output} = \left( (x_{input} + 0.5) * \frac{width_{output}}{width_{input}} \right) - 0.5$$

$$y_{output} = \left( (y_{input} + 0.5) * \frac{height_{output}}{height_{input}} \right) - 0.5$$

- For [VX\\_INTERPOLATION\\_NEAREST\\_NEIGHBOR](#), the output value is that of the pixel whose centre is closest to the sample point [R00111].
- For [VX\\_INTERPOLATION\\_BILINEAR](#), the output value is formed by a weighted average of the nearest source pixels to the sample point [R00112]. That is:

$$x_{lower} = \lfloor x_{input} \rfloor$$

$$y_{lower} = \lfloor y_{input} \rfloor$$

$$s = x_{input} - x_{lower}$$

$$t = y_{input} - y_{lower}$$

$$\begin{aligned} output(x_{input}, y_{input}) = & (1-s)(1-t) * input(x_{lower}, y_{lower}) + s(1-t) * input(x_{lower} + 1, y_{lower}) \\ & + (1-s)t * input(x_{lower}, y_{lower} + 1) + s * t * input(x_{lower} + 1, y_{lower} + 1) \end{aligned}$$

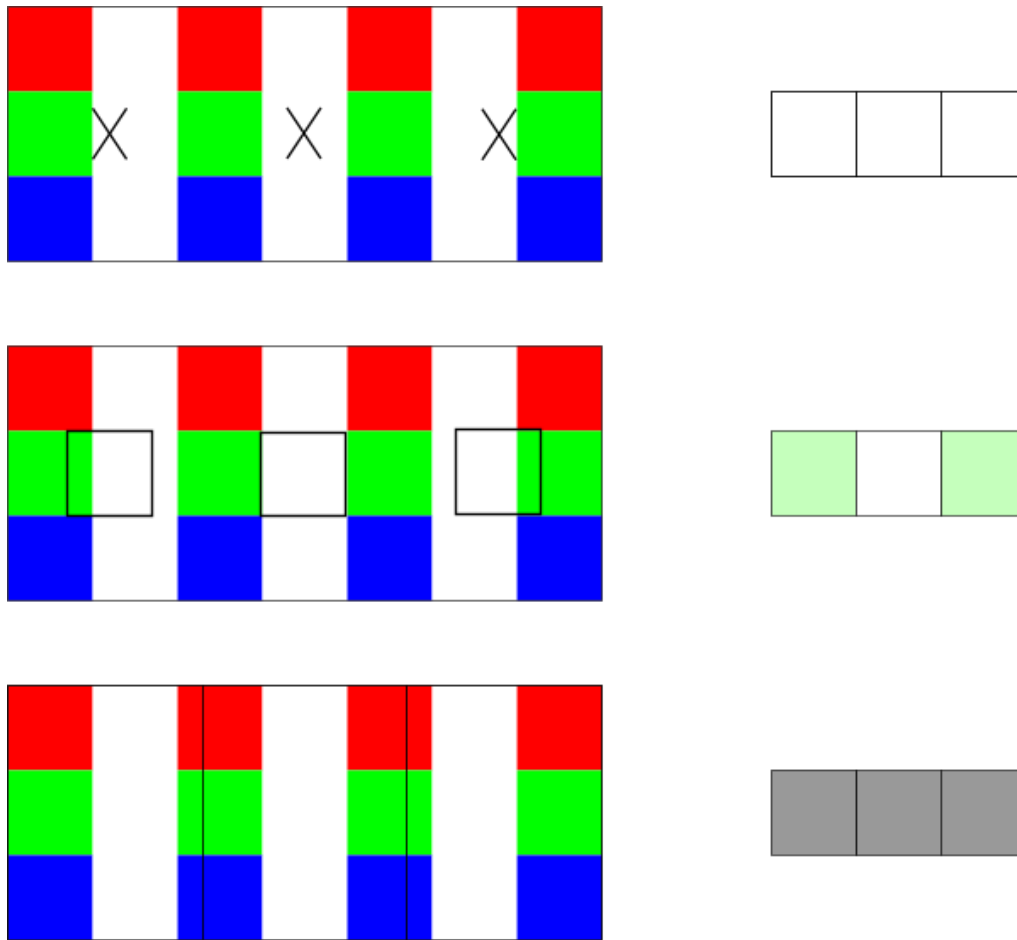

- For [VX\\_INTERPOLATION\\_AREA](#), the implementation is expected to generate each output pixel by sampling all the source pixels that are at least partly covered by the area bounded by [R00113]:

$$\left( x_{output} * \frac{width_{input}}{width_{output}} \right) - 0.5, \left( y_{output} * \frac{height_{input}}{height_{output}} \right) - 0.5$$

and

$$\left( (x_{output} + 1) * \frac{width_{input}}{width_{output}} \right) - 0.5, \left( (y_{output} + 1) * \frac{height_{input}}{height_{output}} \right) - 0.5$$

The details of this sampling method are implementation-defined. The implementation should perform enough sampling to avoid aliasing, but there is no requirement that the sample areas for adjacent output pixels be disjoint, nor that the pixels be weighted evenly.

The above diagram shows three sampling methods used to shrink a 7x3 image to 3x1.

The topmost image pair shows nearest-neighbor sampling, with crosses on the left image marking the sample positions in the source that are used to generate the output image on the right. As the pixel centre closest to the sample position is white in all cases, the resulting 3x1 image is white.

The middle image pair shows bilinear sampling, with black squares on the left image showing the region in the source being sampled to generate each pixel on the destination image on the right. This sample area is always the size of an input pixel. The outer destination pixels partly sample from the outermost green pixels, so their resulting value is a weighted average of white and green.

The bottom image pair shows area sampling. The black rectangles in the source image on the left show the bounds of the projection of the destination pixels onto the source. The destination pixels on the right are formed by averaging at least those source pixels whose areas are wholly or partly contained within those rectangles. The manner of this averaging is implementation-defined; the example shown here weights the contribution of each source pixel by the amount of that pixel's area contained within the black rectangle.

## Functions

- `vx_node VX_API_CALL vxHalfScaleGaussianNode (vx_graph graph, vx_image input, vx_image output, vx_int32 kernel_size)`  
*[Graph] Performs a Gaussian Blur on an image then half-scales it. The interpolation mode used is nearest-neighbor.*
- `vx_node VX_API_CALL vxScaleImageNode (vx_graph graph, vx_image src, vx_image dst, vx_enum type)`  
*[Graph] Creates a Scale Image Node.*

### 3.39.2 Function Documentation

**vxScaleImageNode()**

```
vx_node VX_API_CALL vxScaleImageNode (
 vx_graph graph,
 vx_image src,
 vx_image dst,
 vx_enum type)
```

[Graph] Creates a Scale Image Node.

**Parameters**

|     |              |                                                                                     |
|-----|--------------|-------------------------------------------------------------------------------------|
| in  | <i>graph</i> | The reference to the graph [R00183].                                                |
| in  | <i>src</i>   | The source image of type <a href="#">VX_DF_IMAGE_U8</a> [R00184].                   |
| out | <i>dst</i>   | The destination image of type <a href="#">VX_DF_IMAGE_U8</a> [R00185].              |
| in  | <i>type</i>  | The interpolation type to use. Use a <a href="#">Interpolation Constants</a> value. |

**Note**

The destination image must have a defined size and format [R00186]. The border modes [VX\\_NODE\\_BORDER](#) value [VX\\_BORDER\\_UNDEFINED](#), [VX\\_BORDER\\_REPLICATE](#) and [VX\\_BORDER\\_CONSTANT](#) are supported [R00187].

**Returns**

[vx\\_node](#) [R00188].

**Return values**

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>vx_node</i> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------|----------------------------------------------------------------------------------------------------------------------------|

**vxHalfScaleGaussianNode()**

```
vx_node VX_API_CALL vxHalfScaleGaussianNode (
 vx_graph graph,
 vx_image input,
 vx_image output,
 vx_int32 kernel_size)
```

[Graph] Performs a Gaussian Blur on an image then half-scales it. The interpolation mode used is nearest-neighbor.

The output image size is determined by:

$$W_{output} = \frac{W_{input} + 1}{2}, H_{output} = \frac{H_{input} + 1}{2}$$

**Parameters**

|     |                    |                                                                                  |
|-----|--------------------|----------------------------------------------------------------------------------|
| in  | <i>graph</i>       | The reference to the graph [R00395].                                             |
| in  | <i>input</i>       | The input <a href="#">VX_DF_IMAGE_U8</a> image [R00396].                         |
| out | <i>output</i>      | The output <a href="#">VX_DF_IMAGE_U8</a> image [R00397].                        |
| in  | <i>kernel_size</i> | The input size of the Gaussian filter. Supported values are 1, 3 and 5 [R00398]. |

## Returns

[vx\\_node](#) [R00399].

## Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.40 Sobel 3x3

### 3.40.1 Detailed Description

Implements the Sobel Image Filter Kernel.

This kernel produces two output planes (one can be omitted) in the x and y plane. The Sobel Operators  $G_x, G_y$  are defined as [R00114]:

$$\mathbf{G}_x = \begin{bmatrix} -1 & 0 & +1 \\ -2 & 0 & +2 \\ -1 & 0 & +1 \end{bmatrix}, \mathbf{G}_y = \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ +1 & +2 & +1 \end{bmatrix}$$

### Functions

- `vx_node VX_API_CALL vxSobel3x3Node` (`vx_graph` graph, `vx_image` input, `vx_image` output\_x, `vx_image` output\_y)

[Graph] Creates a Sobel3x3 node.

### 3.40.2 Function Documentation

#### vxSobel3x3Node()

```
vx_node VX_API_CALL vxSobel3x3Node (
 vx_graph graph,
 vx_image input,
 vx_image output_x,
 vx_image output_y)
```

[Graph] Creates a Sobel3x3 node.

#### Parameters

|     |                 |                                                                                                         |
|-----|-----------------|---------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>    | The reference to the graph [R00171].                                                                    |
| in  | <i>input</i>    | The input image in <a href="#">VX_DF_IMAGE_U8</a> format [R00172].                                      |
| out | <i>output_x</i> | [optional] [R00173] The output gradient in the x direction in <a href="#">VX_DF_IMAGE_S16</a> [R00174]. |
| out | <i>output_y</i> | [optional] [R00175] The output gradient in the y direction in <a href="#">VX_DF_IMAGE_S16</a> [R00176]. |

See also

[VX\\_KERNEL\\_SOBEL\\_3x3](#)

Returns

`vx_node` [R00177].

#### Return values

|                      |                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.41 TableLookup

### 3.41.1 Detailed Description

Implements the Table Lookup Image Kernel.

This kernel uses each pixel in an image to index into a LUT and put the indexed LUT value into the output image [R00115]. The formats supported are `VX_DF_IMAGE_U8` and `VX_DF_IMAGE_S16` [R00116].

### Functions

- `vx_node VX_API_CALL vxTableLookupNode (vx_graph graph, vx_image input, vx_lut lut, vx_image output)`  
*[Graph] Creates a Table Lookup node. If a value from the input image is not present in the lookup table, the result is undefined.*

### 3.41.2 Function Documentation

#### `vxTableLookupNode()`

```
vx_node VX_API_CALL vxTableLookupNode (
 vx_graph graph,
 vx_image input,
 vx_lut lut,
 vx_image output)
```

*[Graph] Creates a Table Lookup node. If a value from the input image is not present in the lookup table, the result is undefined.*

#### Parameters

|     |               |                                                                                             |
|-----|---------------|---------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00189].                                                        |
| in  | <i>input</i>  | The input image in <code>VX_DF_IMAGE_U8</code> or <code>VX_DF_IMAGE_S16</code> [R00190].    |
| in  | <i>lut</i>    | The LUT which is of type <code>VX_TYPE_UINT8</code> or <code>VX_TYPE_INT16</code> [R00191]. |
| out | <i>output</i> | The output image of the same type as the input image [R00192].                              |

#### Returns

`vx_node` [R00193].

#### Return values

|                      |                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> . |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|

## 3.42 Thresholding

### 3.42.1 Detailed Description

Thresholds an input image and produces an output Boolean image.

In `VX_THRESHOLD_TYPE_BINARY`, the output is determined by [R00117]:

$$dst(x,y) = \begin{cases} true\ value & \text{if } src(x,y) > threshold \\ false\ value & \text{otherwise} \end{cases}$$

In `VX_THRESHOLD_TYPE_RANGE`, the output is determined by [R00118]:

$$dst(x,y) = \begin{cases} false\ value & \text{if } src(x,y) > upper \\ false\ value & \text{if } src(x,y) < lower \\ true\ value & \text{otherwise} \end{cases}$$

Where 'false value' is the value indicated by the `VX_THRESHOLD_FALSE_VALUE` attribute of the *thresh* parameter, and the 'true value' is the value indicated by the `VX_THRESHOLD_TRUE_VALUE` attribute of the *thresh* parameter [R00119].

### Functions

- `vx_node VX_API_CALL vxThresholdNode (vx_graph graph, vx_image input, vx_threshold thresh, vx_image output)`

[Graph] Creates a Threshold node.

### 3.42.2 Function Documentation

#### `vxThresholdNode()`

```
vx_node VX_API_CALL vxThresholdNode (
 vx_graph graph,
 vx_image input,
 vx_threshold thresh,
 vx_image output)
```

[Graph] Creates a Threshold node.

#### Parameters

|     |               |                                                                                                                                                                                           |
|-----|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00212].                                                                                                                                                      |
| in  | <i>input</i>  | The input image. <code>VX_DF_IMAGE_U8</code> is supported [R00213].                                                                                                                       |
| in  | <i>thresh</i> | The thresholding object that defines the parameters of the operation [R00214]. The <code>VX_THRESHOLD_TRUE_VALUE</code> and <code>VX_THRESHOLD_FALSE_VALUE</code> are taken into account. |
| out | <i>output</i> | The output Boolean image with values either <code>VX_THRESHOLD_TRUE_VALUE</code> or <code>VX_THRESHOLD_FALSE_VALUE</code> from the <i>thresh</i> parameter [R00215].                      |

#### Returns

`vx_node` [R00216].

#### Return values

|                      |                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>vx_node</code> | A node reference. Any possible errors preventing a successful creation should be checked using <code>vxGetStatus</code> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|

## 3.43 Warp Affine

### 3.43.1 Detailed Description

Performs an affine transform on an image.

This kernel performs an affine transform with a 2x3 Matrix  $M$  with this method of pixel coordinate translation [R00120]:

$$x0 = M_{1,1} * x + M_{1,2} * y + M_{1,3} \quad (3.28)$$

$$y0 = M_{2,1} * x + M_{2,2} * y + M_{2,3} \quad (3.29)$$

$$out\ put(x,y) = input(x0,y0) \quad (3.30)$$

This translates into the C declaration:

```
// x0 = a x + b y + c;
// y0 = d x + e y + f;
vx_float32 mat[3][2] = {
 {a, d}, // 'x' coefficients
 {b, e}, // 'y' coefficients
 {c, f}, // 'offsets'
};
vx_matrix matrix = vxCreateMatrix(context,
 VX_TYPE_FLOAT32, 2, 3);
vxCopyMatrix(matrix, mat, VX_WRITE_ONLY,
 VX_MEMORY_TYPE_HOST);
```

## Functions

- `vx_node VX_API_CALL vxWarpAffineNode (vx_graph graph, vx_image input, vx_matrix matrix, vx_enum type, vx_image output)`

[Graph] Creates an Affine Warp Node.

### 3.43.2 Function Documentation

#### vxWarpAffineNode()

```
vx_node VX_API_CALL vxWarpAffineNode (
 vx_graph graph,
 vx_image input,
 vx_matrix matrix,
 vx_enum type,
 vx_image output)
```

[Graph] Creates an Affine Warp Node.

#### Parameters

|     |               |                                                                                                                                       |
|-----|---------------|---------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00345].                                                                                                  |
| in  | <i>input</i>  | The input <code>VX_DF_IMAGE_U8</code> image [R00346].                                                                                 |
| in  | <i>matrix</i> | The affine matrix. Must be 2x3 of type <code>VX_TYPE_FLOAT32</code> [R00347].                                                         |
| in  | <i>type</i>   | The interpolation type from <a href="#">Interpolation Constants</a> [R00348].<br><code>VX_INTERPOLATION_AREA</code> is not supported. |
| out | <i>output</i> | The output <code>VX_DF_IMAGE_U8</code> image [R00349].                                                                                |

#### Note

The border modes `VX_NODE_BORDER` value `VX_BORDER_UNDEFINED` and `VX_BORDER_CONSTANT` are supported.

## Returns

[vx\\_node](#) [R00350].

## Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.44 Warp Perspective

### 3.44.1 Detailed Description

Performs a perspective transform on an image.

This kernel performs an perspective transform with a 3x3 Matrix  $M$  with this method of pixel coordinate translation [R00121]:

$$x0 = M_{1,1} * x + M_{1,2} * y + M_{1,3} \quad (3.31)$$

$$y0 = M_{2,1} * x + M_{2,2} * y + M_{2,3} \quad (3.32)$$

$$z0 = M_{3,1} * x + M_{3,2} * y + M_{3,3} \quad (3.33)$$

$$output(x, y) = input\left(\frac{x0}{z0}, \frac{y0}{z0}\right) \quad (3.34)$$

This translates into the C declaration:

```
// x0 = a x + b y + c;
// y0 = d x + e y + f;
// z0 = g x + h y + i;
vx_float32 mat[3][3] = {
 {a, d, g}, // 'x' coefficients
 {b, e, h}, // 'y' coefficients
 {c, f, i}, // 'offsets'
};
vx_matrix matrix = vxCreateMatrix(context,
 VX_TYPE_FLOAT32, 3, 3);
vxCopyMatrix(matrix, mat, VX_WRITE_ONLY,
 VX_MEMORY_TYPE_HOST);
```

## Functions

- `vx_node VX_API_CALL vxWarpPerspectiveNode` (`vx_graph` graph, `vx_image` input, `vx_matrix` matrix, `vx_enum` type, `vx_image` output)

[Graph] Creates a Perspective Warp Node.

### 3.44.2 Function Documentation

#### vxWarpPerspectiveNode()

```
vx_node VX_API_CALL vxWarpPerspectiveNode (
 vx_graph graph,
 vx_image input,
 vx_matrix matrix,
 vx_enum type,
 vx_image output)
```

[Graph] Creates a Perspective Warp Node.

#### Parameters

|     |               |                                                                                                                                       |
|-----|---------------|---------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>graph</i>  | The reference to the graph [R00351].                                                                                                  |
| in  | <i>input</i>  | The input <code>VX_DF_IMAGE_U8</code> image [R00352].                                                                                 |
| in  | <i>matrix</i> | The perspective matrix. Must be 3x3 of type <code>VX_TYPE_FLOAT32</code> [R00353].                                                    |
| in  | <i>type</i>   | The interpolation type from <a href="#">Interpolation Constants</a> [R00354].<br><code>VX_INTERPOLATION_AREA</code> is not supported. |
| out | <i>output</i> | The output <code>VX_DF_IMAGE_U8</code> image [R00355].                                                                                |

#### Note

The border modes `VX_NODE_BORDER` value `VX_BORDER_UNDEFINED` and `VX_BORDER_CONSTANT` are supported.

## Returns

[vx\\_node](#) [R00356].

## Return values

|                         |                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_node</a> | A node reference. Any possible errors preventing a successful creation should be checked using <a href="#">vxGetStatus</a> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|

## 3.45 Basic Features

### 3.45.1 Detailed Description

The basic parts of OpenVX needed for computation.

Types in OpenVX intended to be derived from the C99 Section 7.18 standard definition of fixed width types.

#### Modules

- [Objects](#)  
*Defines the basic objects within OpenVX.*
- [Macros and Constants](#)  
*Macros and constants not included in other sections.*

#### Data Structures

- struct [vx\\_coordinates2d\\_t](#)  
*The 2D Coordinates structure. [More...](#)*
- struct [vx\\_coordinates3d\\_t](#)  
*The 3D Coordinates structure. [More...](#)*
- struct [vx\\_keypoint\\_t](#)  
*The keypoint data structure. [More...](#)*
- struct [vx\\_rectangle\\_t](#)  
*The rectangle data structure that is shared with the users. The area of the rectangle can be computed as  $(end\_x - start\_x) * (end\_y - start\_y)$ . [More...](#)*

#### Macros

- `#define VX\_MAX\_LOG\_MESSAGE\_LEN (1024)`  
*Defines the length of a message buffer to copy from the log, including the trailing zero [R01653].*
- `#define VX\_VERSION\_VX\_VERSION\_1\_1`  
*Defines the OpenVX Version Number [R01655].*
- `#define VX\_VERSION\_1\_0 (VX\_VERSION\_MAJOR(1) | VX\_VERSION\_MINOR(0))`  
*Defines the predefined version number for 1.0.*
- `#define VX\_VERSION\_1\_1 (VX\_VERSION\_MAJOR(1) | VX\_VERSION\_MINOR(1))`  
*Defines the predefined version number for 1.1.*
- `#define VX\_VERSION\_MAJOR(x) (((x) & 0xFF) << 8)`  
*Defines the major version number macro.*
- `#define VX\_VERSION\_MINOR(x) (((x) & 0xFF) << 0)`  
*Defines the minor version number macro.*

#### Typedefs

- typedef char [vx\\_char](#)  
*An 8 bit ASCII character.*
- typedef uint32\_t [vx\\_df\\_image](#)  
*Used to hold a `VX_DF_IMAGE` code to describe the pixel format and color space.*
- typedef int32\_t [vx\\_enum](#)  
*Sets the standard enumeration type size to be a fixed quantity.*
- typedef float [vx\\_float32](#)  
*A 32-bit float value.*
- typedef double [vx\\_float64](#)  
*A 64-bit float value (aka double).*
- typedef int16\_t [vx\\_int16](#)

- `typedef int32_t vx_int32`  
A 16-bit signed value.
- `typedef int64_t vx_int64`  
A 32-bit signed value.
- `typedef int8_t vx_int8`  
A 64-bit signed value.
- `typedef size_t vx_size`  
An 8-bit signed value.
- `typedef vx_enum vx_status`  
A wrapper of `size_t` to keep the naming convention uniform.
- `typedef uint16_t vx_uint16`  
A formal status type with known fixed size.
- `typedef uint32_t vx_uint32`  
A 16-bit unsigned value.
- `typedef uint64_t vx_uint64`  
A 32-bit unsigned value.
- `typedef uint8_t vx_uint8`  
A 64-bit unsigned value.
- `typedef uint8_t vx_uint8`  
An 8-bit unsigned value.

## Enumerations

- `enum vx_bool { vx_false_e = 0, vx_true_e }`  
A Boolean value. This allows 0 to be FALSE, as it is in C, and any non-zero to be TRUE.

## Functions

- `vx_status VX_API_CALL vxGetStatus (vx_reference reference)`  
Provides a generic API to return status values from Object constructors if they fail.

### 3.45.2 Data Structure Documentation

#### **struct vx\_coordinates2d\_t**

The 2D Coordinates structure.

Definition at line 1685 of file `vx_types.h`.

##### Data Fields

|                        |   |                   |
|------------------------|---|-------------------|
| <code>vx_uint32</code> | x | The X coordinate. |
| <code>vx_uint32</code> | y | The Y coordinate. |

#### **struct vx\_coordinates3d\_t**

The 3D Coordinates structure.

Definition at line 1693 of file `vx_types.h`.

##### Data Fields

|                        |   |                   |
|------------------------|---|-------------------|
| <code>vx_uint32</code> | x | The X coordinate. |
| <code>vx_uint32</code> | y | The Y coordinate. |
| <code>vx_uint32</code> | z | The Z coordinate. |

**struct vx\_keypoint\_t**

The keypoint data structure.

Definition at line 1662 of file [vx\\_types.h](#).

**Data Fields**

|                            |                 |                                                                                  |
|----------------------------|-----------------|----------------------------------------------------------------------------------|
| <a href="#">vx_int32</a>   | x               | The x coordinate.                                                                |
| <a href="#">vx_int32</a>   | y               | The y coordinate.                                                                |
| <a href="#">vx_float32</a> | strength        | The strength of the keypoint. Its definition is specific to the corner detector. |
| <a href="#">vx_float32</a> | scale           | Initialized to 0 by corner detectors.                                            |
| <a href="#">vx_float32</a> | orientation     | Initialized to 0 by corner detectors.                                            |
| <a href="#">vx_int32</a>   | tracking_status | A zero indicates a lost point. Initialized to 1 by corner detectors.             |
| <a href="#">vx_float32</a> | error           | A tracking method specific error. Initialized to 0 by corner detectors.          |

**struct vx\_rectangle\_t**

The rectangle data structure that is shared with the users. The area of the rectangle can be computed as  $(end\_x - start\_x) * (end\_y - start\_y)$ .

Definition at line 1675 of file [vx\\_types.h](#).

**Data Fields**

|                           |         |                         |
|---------------------------|---------|-------------------------|
| <a href="#">vx_uint32</a> | start_x | The Start X coordinate. |
| <a href="#">vx_uint32</a> | start_y | The Start Y coordinate. |
| <a href="#">vx_uint32</a> | end_x   | The End X coordinate.   |
| <a href="#">vx_uint32</a> | end_y   | The End Y coordinate.   |

**3.45.3 Typedef Documentation****vx\_enum**

```
typedef int32_t vx_enum
```

Sets the standard enumeration type size to be a fixed quantity.

All enumerable fields must use this type as the container to enforce enumeration ranges and sizeof() operations.

Definition at line 160 of file [vx\\_types.h](#).

**vx\_status**

```
typedef vx_enum vx_status
```

A formal status type with known fixed size.

See also

[The vx\\_status Constants](#)

Definition at line 434 of file [vx\\_types.h](#).

**3.45.4 Enumeration Type Documentation**

**vx\_bool**

enum `vx_bool`

A Boolean value. This allows 0 to be FALSE, as it is in C, and any non-zero to be TRUE.

```
vx_bool ret = vx_true_e;
if (ret) printf("true!\n");
ret = vx_false_e;
if (!ret) printf("false!\n");
```

This would print both strings.

**Enumerator**

|                         |                    |
|-------------------------|--------------------|
| <code>vx_false_e</code> | The "false" value. |
| <code>vx_true_e</code>  | The "true" value.  |

Definition at line 301 of file `vx_types.h`.

**3.45.5 Function Documentation****vxGetStatus()**

```
vx_status VX_API_CALL vxGetStatus (
 vx_reference reference)
```

Provides a generic API to return status values from Object constructors if they fail.

**Note**

Users do not need to strictly check every object creator as the errors should properly propagate and be detected during verification time or run-time [R00474].

```
vx_image img = vxCreateImage(context, 639, 480,
 VX_DF_IMAGE_UYVY);
vx_status status = vxGetStatus((vx_reference)img);
// status == VX_ERROR_INVALID_DIMENSIONS
vxReleaseImage(&img);
```

**Precondition**

Appropriate Object Creator function.

**Postcondition**

Appropriate Object Release function.

**Parameters**

|    |                        |                                                          |
|----|------------------------|----------------------------------------------------------|
| in | <code>reference</code> | The reference to check for construction errors [R00475]. |
|----|------------------------|----------------------------------------------------------|

**Returns**

A The `vx_status Constants` value.

**Return values**

|                         |                                                                     |
|-------------------------|---------------------------------------------------------------------|
| <code>VX_SUCCESS</code> | No errors; any other value indicates failure [R00476].              |
| *                       | Some error occurred, please check enumeration list and constructor. |

## 3.46 Objects

### 3.46.1 Detailed Description

Defines the basic objects within OpenVX.

All objects in OpenVX derive from a [vx\\_reference](#) and contain a reference to the [vx\\_context](#) from which they were made, except the [vx\\_context](#) itself.

#### Modules

- [Object: Reference](#)  
*Defines the Reference Object interface.*
- [Object: Context](#)  
*Defines the Context Object Interface.*
- [Object: Graph](#)  
*Defines the Graph Object interface.*
- [Object: Node](#)  
*Defines the Node Object interface.*
- [Object: Array](#)  
*Defines the Array Object Interface.*
- [Object: Convolution](#)  
*Defines the Image Convolution Object interface.*
- [Object: Distribution](#)  
*Defines the Distribution Object Interface.*
- [Object: Image](#)  
*Defines the Image Object interface.*
- [Object: LUT](#)  
*Defines the Look-Up Table Interface.*
- [Object: Matrix](#)  
*Defines the Matrix Object Interface.*
- [Object: Pyramid](#)  
*Defines the Image Pyramid Object Interface.*
- [Object: Remap](#)  
*Defines the Remap Object Interface.*
- [Object: Scalar](#)  
*Defines the Scalar Object interface.*
- [Object: Threshold](#)  
*Defines the Threshold Object Interface.*
- [Object: ObjectArray](#)  
*An opaque array object that could be an array of any data-object (not data-type) of OpenVX except Delay and Object↔Array objects.*
- [Object: Import](#)  
*Defines the Import Object interface.*

## 3.47 Object: Reference

### 3.47.1 Detailed Description

Defines the Reference Object interface.

All objects in OpenVX are derived (in the object-oriented sense) from `vx_reference`. All objects shall be able to be cast back to this type safely [R00122].

#### Macros

- `#define VX_MAX_REFERENCE_NAME (64)`  
Defines the length of the reference name string, including the trailing zero [R01654].

#### Typedefs

- `typedef struct _vx_reference * vx_reference`  
A generic opaque reference to any object within OpenVX.

#### Functions

- `vx_status VX_API_CALL vxQueryReference (vx_reference ref, vx_enum attribute, void *ptr, vx_size size)`  
Queries any reference type for some basic information like count or type [R00852].
- `vx_status VX_API_CALL vxReleaseReference (vx_reference *ref_ptr)`  
Releases a reference [R00858]. The reference may potentially refer to multiple OpenVX objects of different types. This function can be used instead of calling a specific release function for each individual object type (e.g. `vxRelease<object>`). The object will not be destroyed until its total reference count is zero.
- `vx_status VX_API_CALL vxRetainReference (vx_reference ref)`  
Increments the reference counter of an object [R00862]. This function is used to express the fact that the OpenVX object is referenced multiple times by an application. Each time this function is called for an object, the application will need to release the object one additional time before it can be destructed.
- `vx_status VX_API_CALL vxSetReferenceName (vx_reference ref, const vx_char *name)`  
Name a reference. This function is used to associate a name to a referenced object [R00865]. This name can be used by the OpenVX implementation in log messages and any other reporting mechanisms.

### 3.47.2 Macro Definition Documentation

#### VX\_MAX\_REFERENCE\_NAME

```
#define VX_MAX_REFERENCE_NAME (64)
```

Defines the length of the reference name string, including the trailing zero [R01654].

See also

`vxSetReferenceName`

Definition at line 56 of file `vx.h`.

### 3.47.3 Typedef Documentation

**vx\_reference**

```
typedef struct _vx_reference* vx_reference
```

A generic opaque reference to any object within OpenVX.

A user of OpenVX should not assume that this can be cast directly to anything; however, any object in OpenVX can be cast back to this for the purposes of querying attributes of the object or for passing the object as a parameter to functions that take a `vx_reference` type. If the API does not take that specific type but may take others, an error may be returned from the API.

Definition at line 153 of file `vx_types.h`.

**3.47.4 Function Documentation****vxQueryReference()**

```
vx_status VX_API_CALL vxQueryReference (
 vx_reference ref,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries any reference type for some basic information like count or type [R00852].

**Parameters**

|     |                  |                                                                                           |
|-----|------------------|-------------------------------------------------------------------------------------------|
| in  | <i>ref</i>       | The reference to query [R00853].                                                          |
| in  | <i>attribute</i> | The value for which to query. Use <a href="#">Reference Attribute Constants</a> [R00854]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00855].                              |
| in  | <i>size</i>      | The size in bytes of the container to which ptr points [R00856].                          |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                         |                                                         |
|-----------------------------------------|---------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00857].  |
| <code>VX_ERROR_INVALID_REFERENCE</code> | ref is not a valid <code>vx_reference</code> reference. |

**vxReleaseReference()**

```
vx_status VX_API_CALL vxReleaseReference (
 vx_reference * ref_ptr)
```

Releases a reference [R00858]. The reference may potentially refer to multiple OpenVX objects of different types. This function can be used instead of calling a specific release function for each individual object type (e.g. `vxRelease<object>`). The object will not be destroyed until its total reference count is zero.

**Note**

After returning from this function the reference is zeroed [R00859].

**Parameters**

|    |                |                                                                 |
|----|----------------|-----------------------------------------------------------------|
| in | <i>ref_ptr</i> | The pointer to the reference of the object to release [R00860]. |
|----|----------------|-----------------------------------------------------------------|

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                             |
|-----------------------------------------|-----------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00861</i> ].             |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <code>ref_ptr</code> is not a valid <a href="#">vx_reference</a> reference. |

**vxRetainReference()**

```
vx_status VX_API_CALL vxRetainReference (
 vx_reference ref)
```

Increments the reference counter of an object [*R00862*]. This function is used to express the fact that the OpenVX object is referenced multiple times by an application. Each time this function is called for an object, the application will need to release the object one additional time before it can be destructed.

## Parameters

|    |            |                                            |
|----|------------|--------------------------------------------|
| in | <i>ref</i> | The reference to retain [ <i>R00863</i> ]. |
|----|------------|--------------------------------------------|

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00864</i> ].         |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <code>ref</code> is not a valid <a href="#">vx_reference</a> reference. |

**vxSetReferenceName()**

```
vx_status VX_API_CALL vxSetReferenceName (
 vx_reference ref,
 const vx_char * name)
```

Name a reference. This function is used to associate a name to a referenced object [*R00865*]. This name can be used by the OpenVX implementation in log messages and any other reporting mechanisms.

The OpenVX implementation will not check if the name is unique in the reference scope (context or graph). Several references can then have the same name.

## Parameters

|    |             |                                                                                                                                                                                                                                                                                                                                                                           |
|----|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>ref</i>  | The reference to the object to be named [ <i>R00866</i> ].                                                                                                                                                                                                                                                                                                                |
| in | <i>name</i> | Pointer to the '\0' terminated string that identifies the referenced object [ <i>R00867</i> ]. The string is copied by the function so that it stays the property of the caller [ <i>R00868</i> ]. NULL means that the reference is not named [ <i>R00869</i> ]. The length of the string shall be lower than <code>VX_MAX_REFERENCE_NAME</code> bytes [ <i>R00870</i> ]. |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00871</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | ref is not a valid <code>vx_reference</code> reference.         |

## 3.48 Object: Context

### 3.48.1 Detailed Description

Defines the Context Object Interface.

The OpenVX context is the object domain for all OpenVX objects. All data objects *live* in the context as well as all framework objects. The OpenVX context keeps reference counts on all objects and must do garbage collection during its deconstruction to free lost references. While multiple clients may connect to the OpenVX context, all data are private in that the references referring to data objects are given only to the creating party.

#### Modules

- [Memory import type constants.](#)

*An enumeration of memory import types.*

- [The termination criteria list.](#)
- [The memory accessor hint flags.](#)

*The memory accessor hint flags. These enumeration values are used to indicate desired system behavior, not the **User** intent. For example: these can be interpreted as hints to the system about cache operations or marshalling operations.*

- [The Round Policy Enumeration.](#)

*The Round Policy Enumeration.*

#### Macros

- `#define VX_MAX_IMPLEMENTATION_NAME (64)`

*Defines the length of the implementation name string, including the trailing zero [R01651].*

#### Typedefs

- `typedef struct _vx_context * vx_context`

*An opaque reference to the implementation context.*

#### Functions

- `vx_context VX_API_CALL vxCreateContext (void)`

*Creates a `vx_context`.*

- `vx_context VX_API_CALL vxGetContext (vx_reference reference)`

*Retrieves the context from any reference from within a context.*

- `vx_status VX_API_CALL vxQueryContext (vx_context context, vx_enum attribute, void *ptr, vx_size size)`

*Queries the context for some specific information.*

- `vx_status VX_API_CALL vxReleaseContext (vx_context *context)`

*Releases the OpenVX object context.*

- `vx_status VX_API_CALL vxSetContextAttribute (vx_context context, vx_enum attribute, const void *ptr, vx_size size)`

*Sets an attribute on the context.*

### 3.48.2 Typedef Documentation

**vx\_context**

```
typedef struct _vx_context* vx_context
```

An opaque reference to the implementation context.

See also

[vxCreateContext](#)

Definition at line 226 of file [vx\\_types.h](#).

**3.48.3 Function Documentation****vxCreateContext()**

```
vx_context VX_API_CALL vxCreateContext (
 void)
```

Creates a [vx\\_context](#).

This creates a top-level object context for OpenVX [*R00444*].

Note

This is required to do anything else.

Returns

The reference to the implementation context [vx\\_context](#) [*R00445*]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [*R00446*].

Postcondition

[vxReleaseContext](#)

**vxReleaseContext()**

```
vx_status VX_API_CALL vxReleaseContext (
 vx_context * context)
```

Releases the OpenVX object context.

All reference counted objects are garbage-collected by the return of this call. No calls are possible using the parameter context after the context has been released until a new reference from [vxCreateContext](#) is returned [*R00447*]. All outstanding references to OpenVX objects from this context are invalid after this call.

Parameters

|    |                |                                                                |
|----|----------------|----------------------------------------------------------------|
| in | <i>context</i> | The pointer to the reference to the context [ <i>R00448</i> ]. |
|----|----------------|----------------------------------------------------------------|

Postcondition

After returning from this function the reference is zeroed [*R00449*].

Returns

A [The vx\\_status Constants](#) value.

Return values

|                                   |                                                                 |
|-----------------------------------|-----------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [ <i>R00450</i> ]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | context is not a valid <a href="#">vx_context</a> reference.    |

Precondition

`vxCreateContext`

### **vxGetContext()**

```
vx_context VX_API_CALL vxGetContext (
 vx_reference reference)
```

Retrieves the context from any reference from within a context.

#### Parameters

|    |                  |                                                           |
|----|------------------|-----------------------------------------------------------|
| in | <i>reference</i> | The reference from which to extract the context [R00451]. |
|----|------------------|-----------------------------------------------------------|

#### Returns

The overall context that created the particular reference [R00452]. Any possible errors preventing a successful completion of this function should be checked using `vxGetStatus` [R00453].

### **vxQueryContext()**

```
vx_status VX_API_CALL vxQueryContext (
 vx_context context,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries the context for some specific information.

#### Parameters

|     |                  |                                                                                     |
|-----|------------------|-------------------------------------------------------------------------------------|
| in  | <i>context</i>   | The reference to the context [R00454].                                              |
| in  | <i>attribute</i> | The attribute to query. Use a <a href="#">Context Attribute Constants</a> [R00455]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00456].                        |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R00457].             |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                          |                                                           |
|------------------------------------------|-----------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00458].    |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | context is not a valid <code>vx_context</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If any of the other parameters are incorrect.             |
| <code>VX_ERROR_NOT_SUPPORTED</code>      | If the attribute is not supported on this implementation. |

### **vxSetContextAttribute()**

```
vx_status VX_API_CALL vxSetContextAttribute (
 vx_context context,
 vx_enum attribute,
```

```
const void * ptr,
vx_size size)
```

Sets an attribute on the context.

#### Parameters

|    |                  |                                                                                 |
|----|------------------|---------------------------------------------------------------------------------|
| in | <i>context</i>   | The handle to the overall context [R00459].                                     |
| in | <i>attribute</i> | The attribute to set from <a href="#">Context Attribute Constants</a> [R00460]. |
| in | <i>ptr</i>       | The pointer to the data to which to set the attribute [R00461].                 |
| in | <i>size</i>      | The size in bytes of the data to which <i>ptr</i> points [R00462].              |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                    |                                                              |
|------------------------------------|--------------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00463].       |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | context is not a valid <a href="#">vx_context</a> reference. |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | If any of the other parameters are incorrect.                |
| <i>VX_ERROR_NOT_SUPPORTED</i>      | If the attribute is not settable.                            |

## 3.49 Object: Graph

### 3.49.1 Detailed Description

Defines the Graph Object interface.

A set of nodes connected in a directed (only goes one-way) acyclic (does not loop back) fashion. A Graph may have sets of Nodes that are unconnected to other sets of Nodes within the same Graph. See [Graph Formalisms](#). Figure below shows the Graph state transition diagram [R00123]. Also see [VX\\_GRAPH\\_STATE Constants](#).

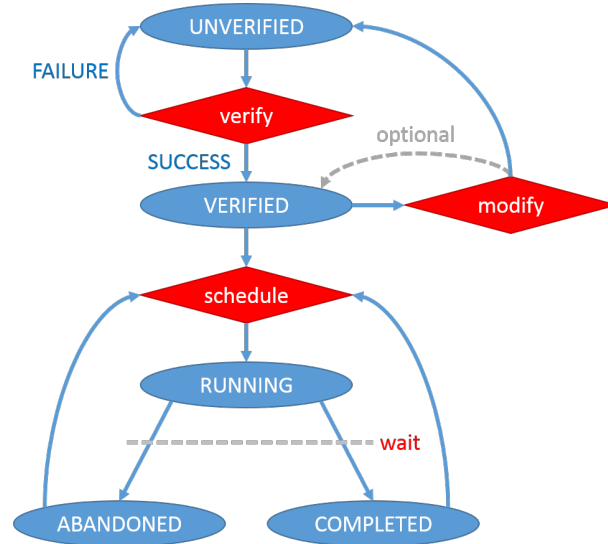

Figure 3.1: Graph State Transition

### Typedefs

- `typedef struct _vx_graph * vx_graph`  
An opaque reference to a graph.

### Functions

- `vx_graph VX_API_CALL vxCreateGraph (vx_context context)`  
Creates an empty graph.
- `vx_bool VX_API_CALL vxIsGraphVerified (vx_graph graph)`  
Returns a Boolean to indicate the state of graph verification.
- `vx_status VX_API_CALL vxProcessGraph (vx_graph graph)`  
This function causes the synchronous processing of a graph. If the graph has not been verified, then the implementation verifies the graph immediately [R00718]. If verification fails this function returns a status identical to what `vxVerifyGraph` would return [R00719]. After the graph verifies successfully then processing occurs [R00720]. If the graph was previously verified via `vxVerifyGraph` or `vxProcessGraph` then the graph is processed [R00721]. This function blocks until the graph is completed [R00722].
- `vx_status VX_API_CALL vxQueryGraph (vx_graph graph, vx_enum attribute, void *ptr, vx_size size)`  
Allows the user to query attributes of the Graph.
- `vx_status VX_API_CALL vxRegisterAutoAging (vx_graph graph, vx_delay delay)`  
Register a delay for auto-aging.
- `vx_status VX_API_CALL vxReleaseGraph (vx_graph *graph)`  
Releases a reference to a graph. The object may not be garbage collected until its total reference count is zero. Once the reference count is zero, all node references in the graph are automatically released as well. Data referenced by those nodes may not be released as the user may have external references to the data.
- `vx_status VX_API_CALL vxScheduleGraph (vx_graph graph)`

Schedules a graph for future execution. If the graph has not been verified, then the implementation verifies the graph immediately [R00725]. If verification fails this function returns a status identical to what [vxVerifyGraph](#) would return [R00726]. After the graph verifies successfully then processing occurs [R00727]. If the graph was previously verified via [vxVerifyGraph](#) or [vxProcessGraph](#) then the graph is processed.

- [vx\\_status VX\\_API\\_CALL vxSetGraphAttribute](#) ([vx\\_graph](#) graph, [vx\\_enum](#) attribute, const void \*ptr, [vx\\_size](#) size)

Allows the attributes of the Graph to be set to the provided value.

- [vx\\_status VX\\_API\\_CALL vxVerifyGraph](#) ([vx\\_graph](#) graph)

Verifies the state of the graph before it is executed. This is useful to catch programmer errors and contract errors. If not verified, the graph verifies before being processed.

- [vx\\_status VX\\_API\\_CALL vxWaitGraph](#) ([vx\\_graph](#) graph)

Waits for a specific graph to complete. If the graph has been scheduled multiple times since the last call to [vxWaitGraph](#), then [vxWaitGraph](#) returns only when the last scheduled execution completes [R00730].

### 3.49.2 Typedef Documentation

#### [vx\\_graph](#)

```
typedef struct _vx_graph* vx_graph
```

An opaque reference to a graph.

See also

[vxCreateGraph](#)

Definition at line 219 of file [vx\\_types.h](#).

### 3.49.3 Function Documentation

#### [vxCreateGraph\(\)](#)

```
vx_graph VX_API_CALL vxCreateGraph (
 vx_context context)
```

Creates an empty graph.

#### Parameters

|    |                |                                                       |
|----|----------------|-------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00708]. |
|----|----------------|-------------------------------------------------------|

#### Returns

A graph reference [vx\\_graph](#) [R00709]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [R00710].

#### [vxReleaseGraph\(\)](#)

```
vx_status VX_API_CALL vxReleaseGraph (
 vx_graph * graph)
```

Releases a reference to a graph. The object may not be garbage collected until its total reference count is zero. Once the reference count is zero, all node references in the graph are automatically released as well. Data referenced by those nodes may not be released as the user may have external references to the data.

**Parameters**

|    |              |                                               |
|----|--------------|-----------------------------------------------|
| in | <i>graph</i> | The pointer to the graph to release [R00711]. |
|----|--------------|-----------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R00712].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00713]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | graph is not a valid <code>vx_graph</code> reference.  |

**vxVerifyGraph()**

```
vx_status VX_API_CALL vxVerifyGraph (
 vx_graph graph)
```

Verifies the state of the graph before it is executed. This is useful to catch programmer errors and contract errors. If not verified, the graph verifies before being processed.

**Precondition**

Memory for data objects is not guaranteed to exist before this call.

**Postcondition**

After this call data objects exist unless the implementation optimized them out [R00714].

**Parameters**

|    |              |                                                |
|----|--------------|------------------------------------------------|
| in | <i>graph</i> | The reference to the graph to verify [R00715]. |
|----|--------------|------------------------------------------------|

**Returns**

A status value.

If a graph has more than one cause of failure, the return value is implementation-dependent. Register a log callback using `vxRegisterLogCallback` to receive each specific error in the graph.

A The `vx_status Constants` value.

**Return values**

|                                         |                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00716].                  |
| <code>VX_ERROR_INVALID_REFERENCE</code> | graph is not a valid <code>vx_graph</code> reference.                   |
| <code>VX_ERROR_MULTIPLE_WRITERS</code>  | If the graph contains more than one writer to any data object [R00717]. |
| <code>VX_ERROR_INVALID_NODE</code>      | If a node in the graph is invalid or failed be created.                 |
| <code>VX_ERROR_INVALID_GRAPH</code>     | If the graph contains cycles or some other invalid topology.            |
| <code>VX_ERROR_INVALID_TYPE</code>      | If any parameter on a node is given the wrong type.                     |
| <code>VX_ERROR_INVALID_VALUE</code>     | If any value of any parameter is out of bounds of specification.        |
| <code>VX_ERROR_INVALID_FORMAT</code>    | If the image format is not compatible.                                  |

See also

[vxProcessGraph](#)

### vxProcessGraph()

```
vx_status VX_API_CALL vxProcessGraph (
 vx_graph graph)
```

This function causes the synchronous processing of a graph. If the graph has not been verified, then the implementation verifies the graph immediately [R00718]. If verification fails this function returns a status identical to what [vxVerifyGraph](#) would return [R00719]. After the graph verifies successfully then processing occurs [R00720]. If the graph was previously verified via [vxVerifyGraph](#) or [vxProcessGraph](#) then the graph is processed [R00721]. This function blocks until the graph is completed [R00722].

#### Parameters

|    |              |                                |
|----|--------------|--------------------------------|
| in | <i>graph</i> | The graph to execute [R00723]. |
|----|--------------|--------------------------------|

#### Returns

A The [vx\\_status Constants](#) value.

#### Return values

|                                   |                                                                       |
|-----------------------------------|-----------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | Graph has been processed; any other value indicates failure [R00724]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | graph is not a valid <a href="#">vx_graph</a> reference.              |
| <i>VX_FAILURE</i>                 | A catastrophic error occurred during processing.                      |

### vxScheduleGraph()

```
vx_status VX_API_CALL vxScheduleGraph (
 vx_graph graph)
```

Schedules a graph for future execution. If the graph has not been verified, then the implementation verifies the graph immediately [R00725]. If verification fails this function returns a status identical to what [vxVerifyGraph](#) would return [R00726]. After the graph verifies successfully then processing occurs [R00727]. If the graph was previously verified via [vxVerifyGraph](#) or [vxProcessGraph](#) then the graph is processed.

#### Parameters

|    |              |                                 |
|----|--------------|---------------------------------|
| in | <i>graph</i> | The graph to schedule [R00728]. |
|----|--------------|---------------------------------|

#### Returns

A The [vx\\_status Constants](#) value.

#### Return values

|                                   |                                                                           |
|-----------------------------------|---------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | The graph has been scheduled; any other value indicates failure [R00729]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | graph is not a valid <a href="#">vx_graph</a> reference.                  |
| <i>VX_ERROR_NO_RESOURCES</i>      | The graph cannot be scheduled now.                                        |
| <i>VX_ERROR_NOT_SUFFICIENT</i>    | The graph is not verified and has failed forced verification.             |

**vxWaitGraph()**

```
vx_status VX_API_CALL vxWaitGraph (
 vx_graph graph)
```

Waits for a specific graph to complete. If the graph has been scheduled multiple times since the last call to vxWaitGraph, then vxWaitGraph returns only when the last scheduled execution completes [R00730].

**Parameters**

|    |              |                                |
|----|--------------|--------------------------------|
| in | <i>graph</i> | The graph to wait on [R00731]. |
|----|--------------|--------------------------------|

**Returns**

A status value.

**Return values**

|                                   |                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | The graph has successfully completed execution and its outputs are the valid results of the most recent execution; any other value indicates failure [R00732]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | graph is not a valid vx_graph reference.                                                                                                                       |
| <i>VX_FAILURE</i>                 | An error occurred or the graph was never scheduled. Output data of the graph is implementation-dependent.                                                      |

**Precondition**

vxScheduleGraph

**vxQueryGraph()**

```
vx_status VX_API_CALL vxQueryGraph (
 vx_graph graph,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Allows the user to query attributes of the Graph.

**Parameters**

|     |                  |                                                                  |
|-----|------------------|------------------------------------------------------------------|
| in  | <i>graph</i>     | The reference to the created graph [R00733].                     |
| in  | <i>attribute</i> | The VX_GRAPH_ Attributes type needed [R00734].                   |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00735].     |
| in  | <i>size</i>      | The size in bytes of the container to which ptr points [R00736]. |

**Returns**

A The vx\_status Constants value.

**Return values**

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R00737]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | graph is not a valid vx_graph reference.               |

**vxSetGraphAttribute()**

```
vx_status VX_API_CALL vxSetGraphAttribute (
 vx_graph graph,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

Allows the attributes of the Graph to be set to the provided value.

**Parameters**

|    |                  |                                                                         |
|----|------------------|-------------------------------------------------------------------------|
| in | <i>graph</i>     | The reference to the graph [R00738].                                    |
| in | <i>attribute</i> | The <a href="#">VX_GRAPH_ Attributes</a> type needed [R00739].          |
| in | <i>ptr</i>       | The location from which to read the value [R00740].                     |
| in | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R00741]. |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                            |                                                          |
|--------------------------------------------|----------------------------------------------------------|
| <a href="#">VX_SUCCESS</a>                 | No errors; any other value indicates failure [R00742].   |
| <a href="#">VX_ERROR_INVALID_REFERENCE</a> | graph is not a valid <a href="#">vx_graph</a> reference. |

**vxIsGraphVerified()**

```
vx_bool VX_API_CALL vxIsGraphVerified (
 vx_graph graph)
```

Returns a Boolean to indicate the state of graph verification.

**Parameters**

|    |              |                                               |
|----|--------------|-----------------------------------------------|
| in | <i>graph</i> | The reference to the graph to check [R00757]. |
|----|--------------|-----------------------------------------------|

**Returns**

A [vx\\_bool](#) value.

**Return values**

|                            |                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">vx_true_e</a>  | The graph is verified [R00758].                                                                                                                                                                                    |
| <a href="#">vx_false_e</a> | The graph is not verified [R00759]. It must be verified before execution either through <a href="#">vxVerifyGraph</a> or automatically through <a href="#">vxProcessGraph</a> or <a href="#">vxScheduleGraph</a> . |

**vxRegisterAutoAging()**

```
vx_status VX_API_CALL vxRegisterAutoAging (
 vx_graph graph,
```

```
vx_delay delay)
```

Register a delay for auto-aging.

This function registers a delay object to be auto-aged by the graph. This delay object will be automatically aged after each successful completion of this graph [R00913]. Aging of a delay object cannot be called during graph execution [R00914]. A graph abandoned due to a node callback will trigger an auto-aging [R00915].

If a delay is registered for auto-aging multiple times in a same graph, the delay will be only aged a single time at each graph completion [R00916]. If a delay is registered for auto-aging in multiple graphs, this delay will aged automatically after each successful completion of any of these graphs [R00917].

#### Parameters

|    |              |                                                                     |
|----|--------------|---------------------------------------------------------------------|
| in | <i>graph</i> | The graph to which the delay is registered for auto-aging [R00918]. |
| in | <i>delay</i> | The delay to automatically age [R00919].                            |

#### Returns

A The `vx_status Constants` value.

#### Return values

|                                         |                                                                                                                |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00920].                                                         |
| <code>VX_ERROR_INVALID_REFERENCE</code> | graph is not a valid <code>vx_graph</code> reference, or delay is not a valid <code>vx_delay</code> reference. |

## 3.50 Object: Node

### 3.50.1 Detailed Description

Defines the Node Object interface.

A node is an instance of a kernel that will be paired with a specific set of references (the parameters). Nodes are created from and associated with a single graph only. When a `vx_parameter` is extracted from a Node, an additional attribute can be accessed:

- *Reference* - The `vx_reference` assigned to this parameter index from the Node creation function, e.g. `vxSobel13x3Node` [R00124].

### Modules

- [The Node Attribute Constants](#)

*The node attributes list.*

### Typedefs

- typedef struct \_vx\_node \* [vx\\_node](#)  
*An opaque reference to a kernel node.*

### Functions

- [vx\\_status VX\\_API\\_CALL vxQueryNode](#) ([vx\\_node](#) node, [vx\\_enum](#) attribute, void \*ptr, [vx\\_size](#) size)  
*Allows a user to query information out of a node.*
- [vx\\_status VX\\_API\\_CALL vxReleaseNode](#) ([vx\\_node](#) \*node)  
*Releases a reference to a Node object. The object may not be garbage collected until its total reference count is zero.*
- [vx\\_status VX\\_API\\_CALL vxRemoveNode](#) ([vx\\_node](#) \*node)  
*Removes a Node from its parent Graph and releases it.*
- [vx\\_status VX\\_API\\_CALL vxReplicateNode](#) ([vx\\_graph](#) graph, [vx\\_node](#) first\_node, [vx\\_bool](#) replicate[], [vx\\_↵](#) uint32 number\_of\_parameters)  
*Creates replicas of the same node first\_node to process a set of objects stored in [vx\\_pyramid](#) or [vx\\_object↵](#) \_array* [R00795]. *first\_node* needs to have as parameter levels 0 of a [vx\\_pyramid](#) or the index 0 of a [vx\\_↵](#) [object\\_array](#). *Replica nodes are not accessible by the application through any means* [R00796]. *An application request for removal of first\_node from the graph will result in removal of all replicas* [R00797]. *Any change of parameter or attribute of first\_node will be propagated to the replicas* [R00798]. [vxVerifyGraph](#) shall enforce consistency of parameters and attributes in the replicas [R00799].
- [vx\\_status VX\\_API\\_CALL vxSetNodeAttribute](#) ([vx\\_node](#) node, [vx\\_enum](#) attribute, const void \*ptr, [vx\\_size](#) size)  
*Allows a user to set attribute of a node before Graph Validation.*
- [vx\\_status VX\\_API\\_CALL vxSetNodeTarget](#) ([vx\\_node](#) node, [vx\\_enum](#) target\_enum, const char \*target\_string)  
*Sets the node target to the provided value. A success invalidates the graph that the node belongs to ([vxVerify↵](#) Graph must be called before the next execution)* [R00790].

### 3.50.2 Typedef Documentation

#### **vx\_node**

```
typedef struct _vx_node* vx_node
```

An opaque reference to a kernel node.

See also

[vxCreateGenericNode](#)

Definition at line 212 of file [vx\\_types.h](#).

### 3.50.3 Function Documentation

#### vxQueryNode()

```
vx_status VX_API_CALL vxQueryNode (
 vx_node node,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Allows a user to query information out of a node.

#### Parameters

|     |                  |                                                                                           |
|-----|------------------|-------------------------------------------------------------------------------------------|
| in  | <i>node</i>      | The reference to the node to query [R00765].                                              |
| in  | <i>attribute</i> | Use <a href="#">The Node Attribute Constants</a> value to query for information [R00766]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00767].                              |
| in  | <i>size</i>      | The size in bytesin bytes of the container to which <i>ptr</i> points [R00768].           |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                    |                                                        |
|------------------------------------|--------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00769]. |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | node is not a valid <a href="#">vx_node</a> reference. |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | The type or size is incorrect.                         |

#### vxSetNodeAttribute()

```
vx_status VX_API_CALL vxSetNodeAttribute (
 vx_node node,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

Allows a user to set attribute of a node before Graph Validation.

#### Parameters

|    |                  |                                                                                               |
|----|------------------|-----------------------------------------------------------------------------------------------|
| in | <i>node</i>      | The reference to the node to set [R00770].                                                    |
| in | <i>attribute</i> | Use <a href="#">The Node Attribute Constants</a> value to set the desired attribute [R00771]. |
| in | <i>ptr</i>       | The pointer to the desired value of the attribute [R00772].                                   |
| in | <i>size</i>      | The size in bytes of the objects to which <i>ptr</i> points [R00773].                         |

#### Note

Some attributes are inherited from the [vx\\_kernel](#), which was used to create the node. Some of these can be overridden using this API, notably [VX\\_NODE\\_LOCAL\\_DATA\\_SIZE](#) and [VX\\_NODE\\_LOCAL\\_DATA\\_PTR](#) [R00774].

## Returns

A The `vx_status Constants` value.

## Return values

|                                          |                                                                             |
|------------------------------------------|-----------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | The attribute was set; any other value indicates failure [ <i>R00775</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | node is not a valid <code>vx_node</code> reference.                         |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | size is not correct for the type needed.                                    |

**vxReleaseNode()**

```
vx_status VX_API_CALL vxReleaseNode (
 vx_node * node)
```

Releases a reference to a Node object. The object may not be garbage collected until its total reference count is zero.

## Parameters

|         |      |                                                                        |
|---------|------|------------------------------------------------------------------------|
| in, out | node | The pointer to the reference of the node to release [ <i>R00776</i> ]. |
|---------|------|------------------------------------------------------------------------|

## Postcondition

After returning from this function the reference is zeroed [*R00777*].

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00778</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | node is not a valid <code>vx_node</code> reference.             |

**vxRemoveNode()**

```
vx_status VX_API_CALL vxRemoveNode (
 vx_node * node)
```

Removes a Node from its parent Graph and releases it.

## Parameters

|         |      |                                                                  |
|---------|------|------------------------------------------------------------------|
| in, out | node | The pointer to the node to remove and release [ <i>R00779</i> ]. |
|---------|------|------------------------------------------------------------------|

## Postcondition

After returning from this function the reference is zeroed [*R00780*].

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00781]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | node is not a valid <code>vx_node</code> reference.    |

**vxSetNodeTarget()**

```
vx_status VX_API_CALL vxSetNodeTarget (
 vx_node node,
 vx_enum target_enum,
 const char * target_string)
```

Sets the node target to the provided value. A success invalidates the graph that the node belongs to (`vx_↵VerifyGraph` must be called before the next execution) [R00790].

## Parameters

|    |                            |                                                                                                                                                                     |
|----|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <code>node</code>          | The reference to the <code>vx_node</code> object [R00791].                                                                                                          |
| in | <code>target_enum</code>   | The target enum to be set to the <code>vx_node</code> object [R00792]. Use a <a href="#">The Target Enumeration Constants</a> . value.                              |
| in | <code>target_string</code> | The target name ASCII string. This contains a valid value when <code>target_enum</code> is set to <code>VX_TARGET_STRING</code> , otherwise it is ignored [R00793]. |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                              |
|-----------------------------------------|--------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | Node target set; any other value indicates failure [R00794]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | node is not a valid <code>vx_node</code> reference.          |
| <code>VX_ERROR_NOT_SUPPORTED</code>     | If the node kernel is not supported by the specified target. |

**vxReplicateNode()**

```
vx_status VX_API_CALL vxReplicateNode (
 vx_graph graph,
 vx_node first_node,
 vx_bool replicate[],
 vx_uint32 number_of_parameters)
```

Creates replicas of the same node `first_node` to process a set of objects stored in `vx_pyramid` or `vx_↵object_array` [R00795]. `first_node` needs to have as parameter levels 0 of a `vx_pyramid` or the index 0 of a `vx_object_array`. Replica nodes are not accessible by the application through any means [R00796]. An application request for removal of `first_node` from the graph will result in removal of all replicas [R00797]. Any change of parameter or attribute of `first_node` will be propagated to the replicas [R00798]. `vxVerifyGraph` shall enforce consistency of parameters and attributes in the replicas [R00799].

## Parameters

|    |                         |                                                                          |
|----|-------------------------|--------------------------------------------------------------------------|
| in | <code>graph</code>      | The reference to the graph [R00800].                                     |
| in | <code>first_node</code> | The reference to the node in the graph that will be replicated [R00801]. |

**Parameters**

|    |                             |                                                                                                                                                                                                                                                                                                                                                                                                  |
|----|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>replicate</i>            | an array of size equal to the number of node parameters, vx_true_e for the parameters that should be iterated over (should be a reference to a vx_pyramid or a vx_object_array), vx_false_e for the parameters that should be the same across replicated nodes and for optional parameters that are not used [R00802]. Should be vx_true_e for all output and bidirectional parameters [R00803]. |
| in | <i>number_of_parameters</i> | number of elements in the replicate array                                                                                                                                                                                                                                                                                                                                                        |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                   |                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R00804].                                                                          |
| <i>VX_ERROR_INVALID_REFERENCE</i> | graph is not a valid <code>vx_graph</code> reference, or first_node is not a valid <code>vx_node</code> reference.              |
| <i>VX_ERROR_NOT_COMPATIBLE</i>    | At least one of replicated parameters is not of level 0 of a pyramid or at index 0 of an object array.                          |
| <i>VX_FAILURE</i>                 | If the node does not belong to the graph, or the number of objects in the parent objects of inputs and output are not the same. |

## 3.51 Object: Array

### 3.51.1 Detailed Description

Defines the Array Object Interface.

Array is a strongly-typed container, which provides random access by index to its elements in constant time. It uses value semantics for its own elements and holds copies of data. This is an example `for` loop over an Array:

```
vx_size i, stride = sizeof(vx_size);
void *base = NULL;
vx_map_id map_id;
/* access entire array at once */
vxMapArrayRange(array, 0, num_items, &map_id, &stride, &base,
VX_READ_AND_WRITE, VX_MEMORY_TYPE_HOST, 0);
for (i = 0; i < num_items; i++)
{
 vxArrayItem(mystruct, base, i, stride).some_uint += i;
 vxArrayItem(mystruct, base, i, stride).some_double = 3.14f;
}
vxUnmapArrayRange(array, map_id);
```

## Modules

- The array object attributes.

*The array object attributes.*

## Macros

- #define `vxArrayItem`(type, ptr, index, stride) (\*(type \*)(`vxFormatArrayPointer`((ptr), (index), (stride))))  
*Allows access to an array item as a typecast pointer deference. [R01287].*
- #define `vxFormatArrayPointer`(ptr, index, stride) (&(((vx\_uint8\*)(ptr))[(index) \* (stride)]))  
*Accesses a specific indexed element in an array. [R01283].*

## Typedefs

- typedef struct \_vx\_array \* `vx_array`  
*The Array Object. Array is a strongly-typed container for other data structures.*

## Functions

- `vx_status VX_API_CALL vxAddArrayItems` (`vx_array` arr, `vx_size` count, const void \*ptr, `vx_size` stride)  
*Adds items to the Array [R01224].*
- `vx_status VX_API_CALL vxCopyArrayRange` (`vx_array` array, `vx_size` range\_start, `vx_size` range\_end, `vx_size` user\_stride, void \*user\_ptr, `vx_enum` usage, `vx_enum` user\_mem\_type)  
*Allows the application to copy a range from/into an array object [R01237].*
- `vx_array VX_API_CALL vxCreateArray` (`vx_context` context, `vx_enum` item\_type, `vx_size` capacity)  
*Creates a reference to an Array object [R01197].*
- `vx_array VX_API_CALL vxCreateVirtualArray` (`vx_graph` graph, `vx_enum` item\_type, `vx_size` capacity)  
*Creates an opaque reference to a virtual Array with no direct user access [R01204].*
- `vx_status VX_API_CALL vxMapArrayRange` (`vx_array` array, `vx_size` range\_start, `vx_size` range\_end, `vx_map_id` \*map\_id, `vx_size` \*stride, void \*\*ptr, `vx_enum` usage, `vx_enum` mem\_type, `vx_uint32` flags)  
*Allows the application to get direct access to a range of an array object [R01252].*
- `vx_status VX_API_CALL vxQueryArray` (`vx_array` arr, `vx_enum` attribute, void \*ptr, `vx_size` size)  
*Queries the Array for some specific information.*
- `vx_status VX_API_CALL vxReleaseArray` (`vx_array` \*arr)  
*Releases a reference of an Array object [R01214]. The object may not be garbage collected until its total reference count is zero [R01215]. After returning from this function the reference is zeroed [R01216].*
- `vx_status VX_API_CALL vxTruncateArray` (`vx_array` arr, `vx_size` new\_num\_items)  
*Truncates an Array (remove items from the end) [R01233].*

- [vx\\_status VX\\_API\\_CALL vxUnmapArrayRange](#) ([vx\\_array](#) array, [vx\\_map\\_id](#) map\_id)

Unmap and commit potential changes to an array object range that was previously mapped [R01276]. Unmapping an array range invalidates the memory location from which the range could be accessed by the application [R01277]. Accessing this memory location after the unmap function completes has an implementation-defined behavior [R01278].

### 3.51.2 Macro Definition Documentation

#### vxFormatArrayPointer

```
#define vxFormatArrayPointer(
 ptr,
 index,
 stride) (&(((vx_uint8*)(ptr))[(index) * (stride)]))
```

Accesses a specific indexed element in an array. [R01283].

##### Parameters

|    |               |                                                                                   |
|----|---------------|-----------------------------------------------------------------------------------|
| in | <i>ptr</i>    | The base pointer for the array range. [R01284]                                    |
| in | <i>index</i>  | The index of the element, not byte, to access. [R01285]                           |
| in | <i>stride</i> | The 'number of bytes' between the beginning of two consecutive elements. [R01286] |

Definition at line [2432](#) of file [vx\\_api.h](#).

#### vxArrayItem

```
#define vxArrayItem(
 type,
 ptr,
 index,
 stride) (*(type *) (vxFormatArrayPointer((ptr), (index), (stride))))
```

Allows access to an array item as a typecast pointer deference. [R01287].

##### Parameters

|    |               |                                                                                   |
|----|---------------|-----------------------------------------------------------------------------------|
| in | <i>type</i>   | The type of the item to access. [R01288]                                          |
| in | <i>ptr</i>    | The base pointer for the array range. [R01289]                                    |
| in | <i>index</i>  | The index of the element, not byte, to access. [R01290]                           |
| in | <i>stride</i> | The 'number of bytes' between the beginning of two consecutive elements. [R01291] |

Definition at line [2443](#) of file [vx\\_api.h](#).

### 3.51.3 Function Documentation

#### vxCreateArray()

```
vx_array VX_API_CALL vxCreateArray (
 vx_context context,
 vx_enum item_type,
 vx_size capacity)
```

Creates a reference to an Array object [R01197].

User must specify the Array capacity (i.e., the maximal number of items that the array can hold).

**Parameters**

|    |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The reference to the overall Context [R01198].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| in | <i>item_type</i> | The type of objects to hold [R01199]. Types allowed are: plain scalar types (i.e. type with enum below <code>VX_TYPE_SCALAR_MAX</code> ), <code>VX_TYPE_RECTANGLE</code> , <code>VX_TYPE_KEYPOINT</code> , <code>VX_TYPE_COORDINATES2D</code> , <code>VX_TYPE_COORDINATES3D</code> and user registered structures [R01200]. Use: <ul style="list-style-type: none"> <li>• <code>VX_TYPE_RECTANGLE</code> for <code>vx_rectangle_t</code>.</li> <li>• <code>VX_TYPE_KEYPOINT</code> for <code>vx_keypoint_t</code>.</li> <li>• <code>VX_TYPE_COORDINATES2D</code> for <code>vx_coordinates2d_t</code>.</li> <li>• <code>VX_TYPE_COORDINATES3D</code> for <code>vx_coordinates3d_t</code>.</li> <li>• <code>vx_enum</code> returned from <code>vxRegisterUserStruct</code>.</li> </ul> |
| in | <i>capacity</i>  | The maximal number of items that the array can hold [R01201].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Returns**

An array reference `vx_array` [R01202]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R01203].

**vxCreateVirtualArray()**

```
vx_array VX_API_CALL vxCreateVirtualArray (
 vx_graph graph,
 vx_enum item_type,
 vx_size capacity)
```

Creates an opaque reference to a virtual Array with no direct user access [R01204].

Virtual Arrays are useful when item type or capacity are unknown ahead of time and the Array is used as internal graph edge. Virtual arrays are scoped within the parent graph only [R01205].

All of the following constructions are allowed.

```
vx_context context = vxCreateContext();
vx_graph graph = vxCreateGraph(context);
vx_array virt[] = {
 vxCreateVirtualArray(graph, 0, 0), // totally unspecified
 vxCreateVirtualArray(graph, VX_TYPE_KEYPOINT, 0), // unspecified
 capacity
 vxCreateVirtualArray(graph, VX_TYPE_KEYPOINT, 1000), // no access
};
```

**Parameters**

|    |                  |                                                                                                                                                                                                                                                                                                                                                                                                    |
|----|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>graph</i>     | The reference to the parent graph [R01206].                                                                                                                                                                                                                                                                                                                                                        |
| in | <i>item_type</i> | The type of objects to hold [R01207]. Types allowed are: plain scalar types (i.e. type with enum below <code>VX_TYPE_SCALAR_MAX</code> ), <code>VX_TYPE_RECTANGLE</code> , <code>VX_TYPE_KEYPOINT</code> , <code>VX_TYPE_COORDINATES2D</code> , <code>VX_TYPE_COORDINATES3D</code> and user registered structures [R01208]. This may be set to zero to indicate an unspecified item type [R01209]. |
| in | <i>capacity</i>  | The maximal number of items that the array can hold [R01210]. This may be set to zero to indicate an unspecified capacity [R01211].                                                                                                                                                                                                                                                                |

See also

[vxCreateArray](#) for a type list.

Returns

A array reference [vx\\_array](#) [R01212]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [R01213].

### vxReleaseArray()

```
vx_status VX_API_CALL vxReleaseArray (
 vx_array * arr)
```

Releases a reference of an Array object [R01214]. The object may not be garbage collected until its total reference count is zero [R01215]. After returning from this function the reference is zeroed [R01216].

Parameters

|    |            |                                               |
|----|------------|-----------------------------------------------|
| in | <i>arr</i> | The pointer to the Array to release [R01217]. |
|----|------------|-----------------------------------------------|

Returns

A [The vx\\_status Constants](#) value.

Return values

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01218]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | arr is not a valid <a href="#">vx_array</a> reference. |

### vxQueryArray()

```
vx_status VX_API_CALL vxQueryArray (
 vx_array arr,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries the Array for some specific information.

Parameters

|     |                  |                                                                                            |
|-----|------------------|--------------------------------------------------------------------------------------------|
| in  | <i>arr</i>       | The reference to the Array [R01219].                                                       |
| in  | <i>attribute</i> | The attribute to query. Use a <a href="#">The array object attributes.</a> value [R01220]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01221].                               |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01222].                    |

Returns

A [The vx\\_status Constants](#) value.

Return values

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01223]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | arr is not a valid <a href="#">vx_array</a> reference. |

## Return values

|                                          |                                                                          |
|------------------------------------------|--------------------------------------------------------------------------|
| <code>VX_ERROR_NOT_SUPPORTED</code>      | If the <i>attribute</i> is not a value supported on this implementation. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If any of the other parameters are incorrect.                            |

**vxAddArrayItems()**

```
vx_status VX_API_CALL vxAddArrayItems (
 vx_array arr,
 vx_size count,
 const void * ptr,
 vx_size stride)
```

Adds items to the Array [R01224].

This function increases the container size [R01225].

By default, the function does not reallocate memory, [R01226] so if the container is already full (number of elements is equal to capacity) or it doesn't have enough space, the function returns `VX_FAILURE` error code [R01227].

## Parameters

|    |               |                                                                                 |
|----|---------------|---------------------------------------------------------------------------------|
| in | <i>arr</i>    | The reference to the Array [R01228].                                            |
| in | <i>count</i>  | The total number of elements to insert [R01229].                                |
| in | <i>ptr</i>    | The location from which to read the input values [R01230].                      |
| in | <i>stride</i> | The number of bytes between the beginning of two consecutive elements [R01231]. |

## Returns

A The `vx_status Constants` value.

## Return values

|                                          |                                                            |
|------------------------------------------|------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01232].     |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | <i>arr</i> is not a valid <code>vx_array</code> reference. |
| <code>VX_FAILURE</code>                  | If the Array is full.                                      |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If any of the other parameters are incorrect.              |

**vxTruncateArray()**

```
vx_status VX_API_CALL vxTruncateArray (
 vx_array arr,
 vx_size new_num_items)
```

Truncates an Array (remove items from the end) [R01233].

## Parameters

|         |                      |                                                 |
|---------|----------------------|-------------------------------------------------|
| in, out | <i>arr</i>           | The reference to the Array [R01234].            |
| in      | <i>new_num_items</i> | The new number of items for the Array [R01235]. |

## Returns

A `The vx_status Constants` value.

## Return values

|                                          |                                                             |
|------------------------------------------|-------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01236].      |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | arr is not a valid <code>vx_array</code> reference.         |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | The <code>new_size</code> is greater than the current size. |

**vxCopyArrayRange()**

```
vx_status VX_API_CALL vxCopyArrayRange (
 vx_array array,
 vx_size range_start,
 vx_size range_end,
 vx_size user_stride,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy a range from/into an array object [R01237].

## Parameters

|    |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <code>array</code>         | The reference to the array object that is the source or the destination of the copy [R01238].                                                                                                                                                                                                                                                                                                                                      |
| in | <code>range_start</code>   | The index of the first item of the array object to copy [R01239].                                                                                                                                                                                                                                                                                                                                                                  |
| in | <code>range_end</code>     | The index of the item following the last item of the array object to copy [R01240]. (range_end - range_start) items are copied from index range_start included [R01241]. The range must be within the bounds of the array:<br>0 <= range_start < range_end <= number of items in the array [R01242].                                                                                                                               |
| in | <code>user_stride</code>   | The number of bytes between the beginning of two consecutive items in the user memory pointed by user_ptr [R01243]. The layout of the user memory must follow an item major order:<br>user_stride >= element size in bytes [R01244].                                                                                                                                                                                               |
| in | <code>user_ptr</code>      | The address of the memory location where to store the requested data if the copy was requested in read mode [R01245], or from where to get the data to store into the array object if the copy was requested in write mode [R01246]. The accessible memory must be large enough to contain the specified range with the specified stride:<br>accessible memory in bytes >= (range_end - range_start) * user_stride [R01247].       |
| in | <code>usage</code>         | This declares the effect of the copy with regard to the array object. Only <code>VX_READ_ONLY</code> and <code>VX_WRITE_ONLY</code> are supported: <ul style="list-style-type: none"> <li><code>VX_READ_ONLY</code> means that data are copied from the array object into the user memory [R01248].</li> <li><code>VX_WRITE_ONLY</code> means that data are copied into the array object from the user memory [R01249].</li> </ul> |
| in | <code>user_mem_type</code> | A <code>Memory import type constants</code> . value that specifies the memory type of the memory referenced by the user_addr [R01250].                                                                                                                                                                                                                                                                                             |

## Returns

A The `vx_status Constants` value.

## Return values

|                                          |                                                                                    |
|------------------------------------------|------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01251].                             |
| <code>VX_ERROR_OPTIMIZED_AWAY</code>     | This is a reference to a virtual array that cannot be accessed by the application. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | array is not a valid <code>vx_array</code> reference.                              |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                                   |

**vxMapArrayRange()**

```
vx_status VX_API_CALL vxMapArrayRange (
 vx_array array,
 vx_size range_start,
 vx_size range_end,
 vx_map_id * map_id,
 vx_size * stride,
 void ** ptr,
 vx_enum usage,
 vx_enum mem_type,
 vx_uint32 flags)
```

Allows the application to get direct access to a range of an array object [R01252].

## Parameters

|     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>array</i>       | The reference to the array object that contains the range to map [R01253].                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| in  | <i>range_start</i> | The index of the first item of the array object to map [R01254].                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| in  | <i>range_end</i>   | The index of the item following the last item of the array object to map [R01255]. (range_end - range_start) items are mapped, starting from index range_start included [R01256]. The range must be within the bounds of the array: Must be $0 \leq \text{range\_start} < \text{range\_end} \leq \text{number of items}$ [R01257].                                                                                                                                                                               |
| out | <i>map_id</i>      | The address of a <code>vx_map_id</code> variable where the function returns a map identifier [R01258]. <ul style="list-style-type: none"> <li>(<code>*map_id</code>) must eventually be provided as the <code>map_id</code> parameter of a call to <code>vxUnmapArrayRange</code>.</li> </ul>                                                                                                                                                                                                                    |
| out | <i>stride</i>      | The address of a <code>vx_size</code> variable where the function returns the memory layout of the mapped array range [R01259]. The function sets ( <code>*stride</code> ) to the number of bytes between the beginning of two consecutive items [R01260]. The application must consult ( <code>*stride</code> ) to access the array items starting from address ( <code>*ptr</code> ). The layout of the mapped array follows an item major order: ( <code>*stride</code> ) $\geq$ item size in bytes [R01261]. |
| out | <i>ptr</i>         | The address of a pointer that the function sets to the address where the requested data can be accessed [R01262]. The returned ( <code>*ptr</code> ) address is only valid between the call to the function and the corresponding call to <code>vxUnmapArrayRange</code> [R01263].                                                                                                                                                                                                                               |

## Parameters

|    |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>usage</i>    | <p>This declares the access mode for the array range [R01264].</p> <ul style="list-style-type: none"> <li>• <b>VX_READ_ONLY</b>: after the function call, the content of the memory location pointed by (*ptr) contains the array range data [R01265]. Writing into this memory location is forbidden and its behavior is implementation-defined [R01266].</li> <li>• <b>VX_READ_AND_WRITE</b>: after the function call, the content of the memory location pointed by (*ptr) contains the array range data [R01267]. Writing into this memory is allowed only for the location of items and will result in a modification of the affected items in the array object once the range is unmapped [R01268]. Writing into a gap between items (when (*stride) &gt; item size in bytes) is forbidden and its behavior is implementation-defined [R01269].</li> <li>• <b>VX_WRITE_ONLY</b>: after the function call, the data at memory location pointed by (*ptr) is implementation-dependent [R01270]. Writing each item of the range is required prior to unmapping [R01271]. Items not written by the application before unmap will have unspecified values after unmap, even if they had well defined values before map. Like for VX_READ_AND_WRITE, writing into a gap between items is forbidden and its behavior is implementation-defined [R01272].</li> </ul> |
| in | <i>mem_type</i> | A <b>Memory import type constants</b> . value that specifies the type of the memory where the array range is requested to be mapped [R01273].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in | <i>flags</i>    | An integer that allows passing options to the map operation [R01274]. Use the <b>The Map/Unmap flag</b> value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Returns

A **The vx\_status Constants** value.

## Return values

|                                    |                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------|
| <b>VX_SUCCESS</b>                  | No errors; any other value indicates failure [R01275].                             |
| <b>VX_ERROR_OPTIMIZED_AWAY</b>     | This is a reference to a virtual array that cannot be accessed by the application. |
| <b>VX_ERROR_INVALID_REFERENCE</b>  | array is not a valid <b>vx_array</b> reference. reference.                         |
| <b>VX_ERROR_INVALID_PARAMETERS</b> | An other parameter is incorrect.                                                   |

## Postcondition

**vxUnmapArrayRange** with same (\*map\_id) value.

**vxUnmapArrayRange()**

```
vx_status VX_API_CALL vxUnmapArrayRange (
 vx_array array,
 vx_map_id map_id)
```

Unmap and commit potential changes to an array object range that was previously mapped [R01276]. Unmapping an array range invalidates the memory location from which the range could be accessed by the application [R01277]. Accessing this memory location after the unmap function completes has an implementation-defined behavior [R01278].

## Parameters

|    |              |                                                      |
|----|--------------|------------------------------------------------------|
| in | <i>array</i> | The reference to the array object to unmap [R01279]. |
|----|--------------|------------------------------------------------------|

**Parameters**

|     |                            |                                                                                                 |
|-----|----------------------------|-------------------------------------------------------------------------------------------------|
| out | <i>map</i> ↔<br><i>_id</i> | The unique map identifier that was returned when calling <code>vxMapArrayRange</code> [R01280]. |
|-----|----------------------------|-------------------------------------------------------------------------------------------------|

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                        |
|------------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01281]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | array is not a valid <code>vx_array</code> reference.  |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                       |

**Precondition**

`vxMapArrayRange` returning the same `map_id` value [R01282].

## 3.52 Object: Convolution

### 3.52.1 Detailed Description

Defines the Image Convolution Object interface.

#### Modules

- [The convolution attributes.](#)  
*The convolution attributes.*

#### Typedefs

- typedef struct \_vx\_convolution \* [vx\\_convolution](#)  
*The Convolution Object. A user-defined convolution kernel of MxM elements [R01411].*

#### Functions

- [vx\\_status VX\\_API\\_CALL vxCopyConvolutionCoefficients](#) ([vx\\_convolution](#) conv, void \*user\_ptr, [vx\\_enum](#) usage, [vx\\_enum](#) user\_mem\_type)  
*Copy coefficients from/into a convolution object [R01114].*
- [vx\\_convolution VX\\_API\\_CALL vxCreateConvolution](#) ([vx\\_context](#) context, [vx\\_size](#) columns, [vx\\_size](#) rows)  
*Creates a reference to a convolution matrix object [R01090].*
- [vx\\_status VX\\_API\\_CALL vxQueryConvolution](#) ([vx\\_convolution](#) conv, [vx\\_enum](#) attribute, void \*ptr, [vx\\_size](#) size)  
*Queries an attribute on the convolution matrix object [R01102].*
- [vx\\_status VX\\_API\\_CALL vxReleaseConvolution](#) ([vx\\_convolution](#) \*conv)  
*Releases the reference to a convolution matrix [R01098]. The object may not be garbage collected until its total reference count is zero.*
- [vx\\_status VX\\_API\\_CALL vxSetConvolutionAttribute](#) ([vx\\_convolution](#) conv, [vx\\_enum](#) attribute, const void \*ptr, [vx\\_size](#) size)  
*Sets attributes on the convolution object [R01108].*

### 3.52.2 Function Documentation

#### vxCreateConvolution()

```
vx_convolution VX_API_CALL vxCreateConvolution (
 vx_context context,
 vx_size columns,
 vx_size rows)
```

Creates a reference to a convolution matrix object [R01090].

#### Parameters

|    |                |                                                                                                                                                                                                    |
|----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the overall context [R01091].                                                                                                                                                     |
| in | <i>columns</i> | The columns dimension of the convolution [R01092]. Must be odd and greater than or equal to 3 and less than the value returned from <a href="#">VX_CONTEXT_CONVOLUTION_MAX_DIMENSION</a> [R01093]. |
| in | <i>rows</i>    | The rows dimension of the convolution [R01094]. Must be odd and greater than or equal to 3 and less than the value returned from <a href="#">VX_CONTEXT_CONVOLUTION_MAX_DIMENSION</a> [R01095].    |

## Returns

A convolution reference `vx_convolution` [R01096]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R01097].

**vxReleaseConvolution()**

```
vx_status VX_API_CALL vxReleaseConvolution (
 vx_convolution * conv)
```

Releases the reference to a convolution matrix [R01098]. The object may not be garbage collected until its total reference count is zero.

## Parameters

|    |             |                                                            |
|----|-------------|------------------------------------------------------------|
| in | <i>conv</i> | The pointer to the convolution matrix to release [R01099]. |
|----|-------------|------------------------------------------------------------|

## Postcondition

After returning from this function the reference is zeroed [R01100].

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                                   |
|-----------------------------------------|-------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01101].            |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <i>conv</i> is not a valid <code>vx_convolution</code> reference. |

**vxQueryConvolution()**

```
vx_status VX_API_CALL vxQueryConvolution (
 vx_convolution conv,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries an attribute on the convolution matrix object [R01102].

## Parameters

|     |                  |                                                                                         |
|-----|------------------|-----------------------------------------------------------------------------------------|
| in  | <i>conv</i>      | The convolution matrix object to set [R01103].                                          |
| in  | <i>attribute</i> | The attribute to query. Use a The <code>convolution attributes</code> . value [R01104]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01105].                            |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01106].                 |

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                                   |
|-----------------------------------------|-------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01107].            |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <i>conv</i> is not a valid <code>vx_convolution</code> reference. |

**vxSetConvolutionAttribute()**

```
vx_status VX_API_CALL vxSetConvolutionAttribute (
 vx_convolution conv,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

Sets attributes on the convolution object [R01108].

**Parameters**

|    |                  |                                                                                            |
|----|------------------|--------------------------------------------------------------------------------------------|
| in | <i>conv</i>      | The coordinates object to set [R01109].                                                    |
| in | <i>attribute</i> | The attribute to modify. Use a <a href="#">The convolution attributes.</a> value [R01110]. |
| in | <i>ptr</i>       | The pointer to the value to which to set the attribute [R01111].                           |
| in | <i>size</i>      | The size in bytes of the data pointed to by <i>ptr</i> [R01112].                           |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                               |
|-----------------------------------|---------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01113].        |
| <i>VX_ERROR_INVALID_REFERENCE</i> | conv is not a valid <a href="#">vx_convolution</a> reference. |

**vxCopyConvolutionCoefficients()**

```
vx_status VX_API_CALL vxCopyConvolutionCoefficients (
 vx_convolution conv,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Copy coefficients from/into a convolution object [R01114].

**Parameters**

|    |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>conv</i>     | The reference to the convolution object that is the source or the destination of the copy [R01115].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| in | <i>user_ptr</i> | The address of the memory location where to store the requested coefficient data if the copy was requested in read mode, or from where to get the coefficient data to store into the convolution object if the copy was requested in write mode [R01116]. In the user memory, the convolution coefficient data is structured as a row-major 2D array with elements of the type corresponding to <a href="#">VX_TYPE_CONVOLUTION</a> , with a number of rows corresponding to <a href="#">VX_CONVOLUTION_ROWS</a> and a number of columns corresponding to <a href="#">VX_CONVOLUTION_COLUMNS</a> [R01117]. The accessible memory must be large enough to contain this 2D array: accessible memory in bytes $\geq \text{sizeof}(\text{data\_element}) * \text{rows} * \text{columns}$ [R01118]. |

**Parameters**

|    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>usage</i>         | This declares the effect of the copy with regard to the convolution object. Only <code>VX_READ_ONLY</code> and <code>VX_WRITE_ONLY</code> are supported [R01119]: <ul style="list-style-type: none"><li>• <code>VX_READ_ONLY</code> means that data are copied from the convolution object into the user memory.</li><li>• <code>VX_WRITE_ONLY</code> means that data are copied into the convolution object from the user memory.</li></ul> |
| in | <i>user_mem_type</i> | A <code>Memory import type constants</code> . value that specifies the memory type of the memory referenced by the <code>user_addr</code> [R01120].                                                                                                                                                                                                                                                                                          |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                            |
|------------------------------------------|------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01121].     |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | conv is not a valid <code>vx_convolution</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                           |

## 3.53 Object: Distribution

### 3.53.1 Detailed Description

Defines the Distribution Object Interface.

#### Modules

- [The distribution attribute list.](#)

#### Typedefs

- typedef struct \_vx\_distribution \* [vx\\_distribution](#)

*The Distribution object. This has a user-defined number of bins over a user-defined range (within a uint32\_t range).*

#### Functions

- [vx\\_status VX\\_API\\_CALL vxCopyDistribution](#) ([vx\\_distribution](#) distribution, void \*user\_ptr, [vx\\_enum](#) usage, [vx\\_enum](#) user\_mem\_type)  
*Allows the application to copy from/into a distribution object [R00998].*
- [vx\\_distribution VX\\_API\\_CALL vxCreateDistribution](#) ([vx\\_context](#) context, [vx\\_size](#) numBins, [vx\\_int32](#) offset, [vx\\_uint32](#) range)  
*Creates a reference to a 1D Distribution of a consecutive interval [offset, offset + range - 1] defined by a start offset and valid range, divided equally into numBins parts [R00982].*
- [vx\\_status VX\\_API\\_CALL vxMapDistribution](#) ([vx\\_distribution](#) distribution, [vx\\_map\\_id](#) \*map\_id, void \*\*ptr, [vx\\_enum](#) usage, [vx\\_enum](#) mem\_type, [vx\\_bitfield](#) flags)  
*Allows the application to get direct access to distribution object [R01006].*
- [vx\\_status VX\\_API\\_CALL vxQueryDistribution](#) ([vx\\_distribution](#) distribution, [vx\\_enum](#) attribute, void \*ptr, [vx\\_size](#) size)  
*Queries a Distribution object [R00992].*
- [vx\\_status VX\\_API\\_CALL vxReleaseDistribution](#) ([vx\\_distribution](#) \*distribution)  
*Releases a reference to a distribution object [R00988]. The object may not be garbage collected until its total reference count is zero.*
- [vx\\_status VX\\_API\\_CALL vxUnmapDistribution](#) ([vx\\_distribution](#) distribution, [vx\\_map\\_id](#) map\_id)  
*Unmap and commit potential changes to distribution object that was previously mapped [R01023]. Unmapping a distribution invalidates the memory location from which the distribution data could be accessed by the application. Accessing this memory location after the unmap function completes has an implementation dependant behavior [R01024].*

### 3.53.2 Function Documentation

#### vxCreateDistribution()

```
vx_distribution VX_API_CALL vxCreateDistribution (
 vx_context context,
 vx_size numBins,
 vx_int32 offset,
 vx_uint32 range)
```

Creates a reference to a 1D Distribution of a consecutive interval [offset, offset + range - 1] defined by a start offset and valid range, divided equally into numBins parts [R00982].

#### Parameters

|    |                |                                                  |
|----|----------------|--------------------------------------------------|
| in | <i>context</i> | The reference to the overall context [R00983].   |
| in | <i>numBins</i> | The number of bins in the distribution [R00984]. |

**Parameters**

|    |               |                                                                                                 |
|----|---------------|-------------------------------------------------------------------------------------------------|
| in | <i>offset</i> | The start offset into the range value that marks the beginning of the 1D Distribution [R00985]. |
| in | <i>range</i>  | The total number of the consecutive values of the distribution interval [R00986].               |

**Returns**

A distribution reference `vx_distribution` [R00987]. Any possible errors preventing a successful creation should be checked using `vxGetStatus`.

**vxReleaseDistribution()**

```
vx_status VX_API_CALL vxReleaseDistribution (
 vx_distribution * distribution)
```

Releases a reference to a distribution object [R00988]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |                     |                                                        |
|----|---------------------|--------------------------------------------------------|
| in | <i>distribution</i> | The reference to the distribution to release [R00989]. |
|----|---------------------|--------------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R00990].

**Returns**

A `The vx_status Constants` value.

**Return values**

|                                         |                                                                     |
|-----------------------------------------|---------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00991].              |
| <code>VX_ERROR_INVALID_REFERENCE</code> | distribution is not a valid <code>vx_distribution</code> reference. |

**vxQueryDistribution()**

```
vx_status VX_API_CALL vxQueryDistribution (
 vx_distribution distribution,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries a Distribution object [R00992].

**Parameters**

|     |                     |                                                                                              |
|-----|---------------------|----------------------------------------------------------------------------------------------|
| in  | <i>distribution</i> | The reference to the distribution to query [R00993].                                         |
| in  | <i>attribute</i>    | The attribute to query. Use a <code>The distribution attribute list</code> . value [R00994]. |
| out | <i>ptr</i>          | The location at which to store the resulting value [R00995].                                 |
| in  | <i>size</i>         | The size in bytes of the container to which <i>ptr</i> points [R00996].                      |

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                                     |
|-----------------------------------------|---------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00997].              |
| <code>VX_ERROR_INVALID_REFERENCE</code> | distribution is not a valid <code>vx_distribution</code> reference. |

**vxCopyDistribution()**

```
vx_status VX_API_CALL vxCopyDistribution (
 vx_distribution distribution,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy from/into a distribution object [R00998].

## Parameters

|    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>distribution</i>  | The reference to the distribution object that is the source or the destination of the copy [R00999].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| in | <i>user_ptr</i>      | The address of the memory location where to store the requested data if the copy was requested in read mode, or from where to get the data to store into the distribution object if the copy was requested in write mode [R01000]. In the user memory, the distribution is represented as a <code>vx_uint32</code> array with a number of elements equal to the value returned via <code>VX_DISTRIBUTION_BINS</code> . The accessible memory must be large enough to contain this <code>vx_uint32</code> array: accessible memory in bytes $\geq$ <code>sizeof(vx_uint32) * num_bins</code> [R01001]. |
| in | <i>usage</i>         | This declares the effect of the copy with regard to the distribution object [R01002]<br>Only <code>VX_READ_ONLY</code> and <code>VX_WRITE_ONLY</code> are supported [R01003]: <ul style="list-style-type: none"> <li><code>VX_READ_ONLY</code> means that data are copied from the distribution object into the user memory.</li> <li><code>VX_WRITE_ONLY</code> means that data are copied into the distribution object from the user memory.</li> </ul>                                                                                                                                             |
| in | <i>user_mem_type</i> | A <code>Memory import type constants</code> . value that specifies the memory type of the memory referenced by the <code>user_addr</code> [R01004].                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Returns

A The `vx_status Constants` value.

## Return values

|                                          |                                                                     |
|------------------------------------------|---------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01005].              |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | distribution is not a valid <code>vx_distribution</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                    |

**vxMapDistribution()**

```

vx_status VX_API_CALL vxMapDistribution (
 vx_distribution distribution,
 vx_map_id * map_id,
 void ** ptr,
 vx_enum usage,
 vx_enum mem_type,
 vx_bitfield flags)

```

Allows the application to get direct access to distribution object [R01006].

**Parameters**

|     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>distribution</i> | The reference to the distribution object to map [R01007].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| out | <i>map_id</i>       | <p>The address of a <code>vx_map_id</code> variable where the function returns a map identifier [R01008].</p> <ul style="list-style-type: none"> <li>• (<code>*map_id</code>) must eventually be provided as the <code>map_id</code> parameter of a call to <code>vxUnmapDistribution</code> [R01009].</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| out | <i>ptr</i>          | <p>The address of a pointer that the function sets to the address where the requested data can be accessed [R01010]. In the mapped memory area, data are structured as a <code>vx_uint32</code> array with a number of elements equal to the value returned via <code>VX_DISTRIBUTION_BINS</code>. Each element of this array corresponds to a bin of the distribution, with a range-major ordering. Accessing the memory out of the bound of this array is forbidden and is implementation dependant [R01011]. The returned (<code>*ptr</code>) address is only valid between the call to the function and the corresponding call to <code>vxUnmapDistribution</code> [R01012].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| in  | <i>usage</i>        | <p>This declares the access mode for the distribution [R01013]</p> <ul style="list-style-type: none"> <li>• <code>VX_READ_ONLY</code>: after the function call, the content of the memory location pointed by (<code>*ptr</code>) contains the distribution data [R01014]. Writing into this memory location is forbidden and its behavior is implementation dependant.</li> <li>• <code>VX_READ_AND_WRITE</code>: after the function call, the content of the memory location pointed by (<code>*ptr</code>) contains the distribution data [R01015]; writing into this memory is allowed only for the location of bins and will result in a modification of the affected bins in the distribution object once the distribution is unmapped [R01016].</li> <li>• <code>VX_WRITE_ONLY</code>: after the function call, the data at memory location pointed by (<code>*ptr</code>) is implementation-dependent; writing each bin of distribution is required prior to unmapping [R01017]. Bins not written by the application before unmap will become implementation-dependent after unmap, even if they were well defined before map.</li> </ul> |
| in  | <i>mem_type</i>     | A <code>Memory import type constants</code> . value that specifies the type of the memory where the distribution is requested to be mapped [R01018].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| in  | <i>flags</i>        | An integer that allows passing options to the map operation [R01019]. Use 0 for this option [R01020].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Returns**

A `The vx_status Constants` value.

**Return values**

|                                          |                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01021].                         |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | distribution is not a valid <code>vx_distribution</code> reference. reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                               |

Postcondition

`vxUnmapDistribution` with same (`*map_id`) value [R01022].

### `vxUnmapDistribution()`

```
vx_status VX_API_CALL vxUnmapDistribution (
 vx_distribution distribution,
 vx_map_id map_id)
```

Unmap and commit potential changes to distribution object that was previously mapped [R01023]. Unmapping a distribution invalidates the memory location from which the distribution data could be accessed by the application. Accessing this memory location after the unmap function completes has an implementation dependant behavior [R01024].

#### Parameters

|     |                     |                                                                                                   |
|-----|---------------------|---------------------------------------------------------------------------------------------------|
| in  | <i>distribution</i> | The reference to the distribution object to unmap [R01025].                                       |
| out | <i>map_id</i>       | The unique map identifier that was returned when calling <code>vxMapDistribution</code> [R01026]. |

#### Returns

A The `vx_status Constants` value.

#### Return values

|                                          |                                                                     |
|------------------------------------------|---------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01027].              |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | distribution is not a valid <code>vx_distribution</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                    |

#### Precondition

`vxMapDistribution` returning the same `map_id` value [R01028].

## 3.54 Object: Image

### 3.54.1 Detailed Description

Defines the Image Object interface.

#### Modules

- [The Image Attributes Constants](#)  
*The image attributes list.*
- [Image Color Space Constants](#)  
*The image color space list used by the `VX_IMAGE_SPACE` attribute of a `vx_image`.*
- [Image Channel Range Constants](#)  
*The image channel range list used by the `VX_IMAGE_RANGE` attribute of a `vx_image`.*

#### Data Structures

- struct [vx\\_imagepatch\\_addressing\\_t](#)  
*The addressing image patch structure is used by the Host only to address pixels in an image patch. The fields of the structure are defined as: [More...](#)*
- union [vx\\_pixel\\_value\\_t](#)  
*Union that describes the value of a pixel for any image format. Use the field corresponding to the image format. [More...](#)*

#### Macros

- `#define VX\_IMAGEPATCH\_ADDR\_INIT {0u, 0u, 0, 0, 0u, 0u, 0u, 0u}`  
*Use to initialize a `vx_imagepatch_addressing_t` structure on the stack.*

#### Typedefs

- typedef struct \_vx\_image \* [vx\\_image](#)  
*An opaque reference to an image.*
- typedef uintptr\_t [vx\\_map\\_id](#)  
*Holds the address of a variable where the map/unmap functions return a map identifier.*

#### Functions

- [vx\\_size](#) [VX\\_API\\_CALL](#) [vxComputeImagePatchSize](#) ([vx\\_image](#) image, const [vx\\_rectangle\\_t](#) \*rect, [vx\\_uint32](#) plane\_index)  
*This computes the size needed to retrieve an image patch from an image.*
- [vx\\_status](#) [VX\\_API\\_CALL](#) [vxCopyImagePatch](#) ([vx\\_image](#) image, const [vx\\_rectangle\\_t](#) \*image\_rect, [vx\\_uint32](#) image\_plane\_index, const [vx\\_imagepatch\\_addressing\\_t](#) \*user\_addr, void \*user\_ptr, [vx\\_enum](#) usage, [vx\\_enum](#) user\_mem\_type)  
*Allows the application to copy a rectangular patch from/into an image object plane.*
- [vx\\_image](#) [VX\\_API\\_CALL](#) [vxCreateImage](#) ([vx\\_context](#) context, [vx\\_uint32](#) width, [vx\\_uint32](#) height, [vx\\_df\\_image](#) color)  
*Creates an opaque reference to an image buffer.*
- [vx\\_image](#) [VX\\_API\\_CALL](#) [vxCreateImageFromChannel](#) ([vx\\_image](#) img, [vx\\_enum](#) channel)  
*Create a sub-image from a single plane channel of another image.*
- [vx\\_image](#) [VX\\_API\\_CALL](#) [vxCreateImageFromHandle](#) ([vx\\_context](#) context, [vx\\_df\\_image](#) color, const [vx\\_imagepatch\\_addressing\\_t](#) \*addrs[], void \*const ptrs[], [vx\\_enum](#) memory\_type)  
*Creates a reference to an image object that was externally allocated.*
- [vx\\_image](#) [VX\\_API\\_CALL](#) [vxCreateImageFromROI](#) ([vx\\_image](#) img, const [vx\\_rectangle\\_t](#) \*rect)

Creates an image from another image given a rectangle. This second reference refers to the data in the original image [R00501]. Updates to this image updates the parent image [R00502]. The rectangle must be defined within the pixel space of the parent image [R00503].

- **vx\_image VX\_API\_CALL vxCreateUniformImage** (vx\_context context, vx\_uint32 width, vx\_uint32 height, vx\_df\_image color, const vx\_pixel\_value\_t \*value)  
Creates a reference to an image object that has a singular, uniform value in all pixels [R00508]. The uniform image created is read-only [R00509].
- **vx\_image VX\_API\_CALL vxCreateVirtualImage** (vx\_graph graph, vx\_uint32 width, vx\_uint32 height, vx\_df\_image color)  
Creates an opaque reference to an image buffer with no direct user access. This function allows setting the image width, height, or format [R00519].
- **void \*VX\_API\_CALL vxFormatImagePatchAddress1d** (void \*ptr, vx\_uint32 index, const vx\_imagepatch\_addressing\_t \*addr)  
Accesses a specific indexed pixel in an image patch.
- **void \*VX\_API\_CALL vxFormatImagePatchAddress2d** (void \*ptr, vx\_uint32 x, vx\_uint32 y, const vx\_imagepatch\_addressing\_t \*addr)  
Accesses a specific pixel at a 2d coordinate in an image patch.
- **vx\_status VX\_API\_CALL vxGetValidRegionImage** (vx\_image image, vx\_rectangle\_t \*rect)  
Retrieves the valid region of the image as a rectangle.
- **vx\_status VX\_API\_CALL vxMapImagePatch** (vx\_image image, const vx\_rectangle\_t \*rect, vx\_uint32 plane\_index, vx\_map\_id \*map\_id, vx\_imagepatch\_addressing\_t \*addr, void \*\*ptr, vx\_enum usage, vx\_enum mem\_type, vx\_uint32 flags)  
Allows the application to get direct access to a rectangular patch of an image object plane.
- **vx\_status VX\_API\_CALL vxQueryImage** (vx\_image image, vx\_enum attribute, void \*ptr, vx\_size size)  
Retrieves various attributes of an image.
- **vx\_status VX\_API\_CALL vxReleaseImage** (vx\_image \*image)  
Releases a reference to an image object. The object may not be garbage collected until its total reference count is zero.
- **vx\_status VX\_API\_CALL vxSetImageAttribute** (vx\_image image, vx\_enum attribute, const void \*ptr, vx\_size size)  
Allows setting attributes on the image.
- **vx\_status VX\_API\_CALL vxSetImageValidRectangle** (vx\_image image, const vx\_rectangle\_t \*rect)  
Sets the valid rectangle for an image according to a supplied rectangle.
- **vx\_status VX\_API\_CALL vxSwapImageHandle** (vx\_image image, void \*const new\_ptrs[], void \*prev\_ptrs[], vx\_size num\_planes)  
Swaps the image handle of an image previously created from handle.
- **vx\_status VX\_API\_CALL vxUnmapImagePatch** (vx\_image image, vx\_map\_id map\_id)  
Unmap and commit potential changes to a image object patch that were previously mapped. Unmapping an image patch invalidates the memory location from which the patch could be accessed by the application. Accessing this memory location after the unmap function completes has an implementation-dependent behavior.

### 3.54.2 Data Structure Documentation

#### struct vx\_imagepatch\_addressing\_t

The addressing image patch structure is used by the Host only to address pixels in an image patch. The fields of the structure are defined as:

- **dim** - The dimensions of the image in logical pixel units in the x & y direction.
- **stride** - The physical byte distance from a logical pixel to the next logically adjacent pixel in the positive x or y direction.
- **scale** - The relationship of scaling from the primary plane (typically the zero indexed plane) to this plane. An integer down-scaling factor of  $f$  shall be set to a value equal to  $scale = \frac{unity}{f}$  and an integer up-scaling factor of  $f$  shall be set to a value of  $scale = unity * f$ . *unity* is defined as **VX\_SCALE\_UNITY**.

- step - The step is the number of logical pixel units to skip to arrive at the next physically unique pixel. For example, on a plane that is half-scaled in a dimension, the step in that dimension is 2 to indicate that every other pixel in that dimension is an alias. This is useful in situations where iteration over unique pixels is required, such as in serializing or de-serializing the image patch information.

### 3.54.3 Typedef Documentation

#### vx\_image

```
typedef struct _vx_image* vx_image
```

An opaque reference to an image.

See also

[vxCreateImage](#)

Definition at line 190 of file [vx\\_types.h](#).

### 3.54.4 Function Documentation

#### vxCreateImage()

```
vx_image VX_API_CALL vxCreateImage (
 vx_context context,
 vx_uint32 width,
 vx_uint32 height,
 vx_df_image color)
```

Creates an opaque reference to an image buffer.

Not guaranteed to exist until the [vx\\_graph](#) containing it has been verified.

#### Parameters

|    |                |                                                                                                                                                                                                                                                                             |
|----|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00493].                                                                                                                                                                                                                       |
| in | <i>width</i>   | The image width in pixels [R00494]. The image in the formats of <a href="#">VX_DF_IMAGE_NV12</a> , <a href="#">VX_DF_IMAGE_NV21</a> , <a href="#">VX_DF_IMAGE_IYUV</a> , <a href="#">VX_DF_IMAGE_UYVY</a> , <a href="#">VX_DF_IMAGE_YUYV</a> must have even width [R00495]. |
| in | <i>height</i>  | The image height in pixels [R00496]. The image in the formats of <a href="#">VX_DF_IMAGE_NV12</a> , <a href="#">VX_DF_IMAGE_NV21</a> , <a href="#">VX_DF_IMAGE_IYUV</a> must have even height [R00497].                                                                     |
| in | <i>color</i>   | The <a href="#">VX_DF_IMAGE</a> ( <a href="#">Image Type Constants</a> ) code that represents the format of the image and the color space [R00498].                                                                                                                         |

#### Returns

An image reference [vx\\_image](#) [R00499]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [R00500].

See also

[vxMapImagePatch](#) to obtain direct memory access to the image data.

#### vxCreateImageFromROI()

```
vx_image VX_API_CALL vxCreateImageFromROI (
 vx_image img,
 const vx_rectangle_t * rect)
```

Creates an image from another image given a rectangle. This second reference refers to the data in the original image [R00501]. Updates to this image updates the parent image [R00502]. The rectangle must be defined within the pixel space of the parent image [R00503].

#### Parameters

|    |             |                                                                                                     |
|----|-------------|-----------------------------------------------------------------------------------------------------|
| in | <i>img</i>  | The reference to the parent image [R00504].                                                         |
| in | <i>rect</i> | The region of interest rectangle [R00505]. Must contain points within the parent image pixel space. |

## Returns

An image reference `vx_image` to the sub-image [R00506]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00507].

**vxCreateUniformImage()**

```
vx_image VX_API_CALL vxCreateUniformImage (
 vx_context context,
 vx_uint32 width,
 vx_uint32 height,
 vx_df_image color,
 const vx_pixel_value_t * value)
```

Creates a reference to an image object that has a singular, uniform value in all pixels [R00508]. The uniform image created is read-only [R00509].

## Parameters

|    |                |                                                                                                                                                                                                                                                              |
|----|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00510].                                                                                                                                                                                                        |
| in | <i>width</i>   | The image width in pixels [R00511]. The image in the formats of <code>VX_DF_IMAGE_NV12</code> , <code>VX_DF_IMAGE_NV21</code> , <code>VX_DF_IMAGE_IYUV</code> , <code>VX_DF_IMAGE_UYVY</code> , <code>VX_DF_IMAGE_YUYV</code> must have even width [R00512]. |
| in | <i>height</i>  | The image height in pixels [R00513]. The image in the formats of <code>VX_DF_IMAGE_NV12</code> , <code>VX_DF_IMAGE_NV21</code> , <code>VX_DF_IMAGE_IYUV</code> must have even height [R00514].                                                               |
| in | <i>color</i>   | The <code>VX_DF_IMAGE</code> (Image Type Constants) code that represents the format of the image and the color space [R00515].                                                                                                                               |
| in | <i>value</i>   | The pointer to the pixel value to which to set all pixels [R00516]. See <code>vx_pixel_value_t</code> .                                                                                                                                                      |

## Returns

An image reference `vx_image` [R00517]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00518].

## See also

`vxMapImagePatch` to obtain direct memory access to the image data.

## Note

`vxMapImagePatch` and `vxUnmapImagePatch` may be called with a uniform image reference.

**vxCreateVirtualImage()**

```
vx_image VX_API_CALL vxCreateVirtualImage (
 vx_graph graph,
 vx_uint32 width,
 vx_uint32 height,
 vx_df_image color)
```

Creates an opaque reference to an image buffer with no direct user access. This function allows setting the image width, height, or format [R00519].

Virtual data objects allow users to connect various nodes within a graph via data references without access to that data, but they also permit the implementation to take maximum advantage of possible optimizations. Use this API to create a data reference to link two or more nodes together when the intermediate data are not required to be accessed by outside entities. This API in particular allows the user to define the image format of the data without requiring the exact dimensions. Virtual objects are scoped within the graph they are declared a part of, and can't be shared outside of this scope [R00520]. All of the following constructions of virtual images are valid.

```

vx_context context = vxCreateContext();
vx_graph graph = vxCreateGraph(context);
vx_image virt[] = {
 vxCreateVirtualImage(graph, 0, 0, VX_DF_IMAGE_U8), // no specified
 dimension
 vxCreateVirtualImage(graph, 320, 240, VX_DF_IMAGE_VIRT), // no
 specified format
 vxCreateVirtualImage(graph, 640, 480, VX_DF_IMAGE_U8), // no user
 access
};

```

#### Parameters

|    |               |                                                                                                                                                                                                                                                                                                                                                         |
|----|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>graph</i>  | The reference to the parent graph [R00521].                                                                                                                                                                                                                                                                                                             |
| in | <i>width</i>  | The width of the image in pixels [R00522]. A value of zero informs the interface that the value is unspecified. The image in the formats of <a href="#">VX_DF_IMAGE_NV12</a> , <a href="#">VX_DF_IMAGE_NV21</a> , <a href="#">VX_DF_IMAGE_IYUV</a> , <a href="#">VX_DF_IMAGE_UYVY</a> , <a href="#">VX_DF_IMAGE_YUYV</a> must have even width [R00523]. |
| in | <i>height</i> | The height of the image in pixels [R00524]. A value of zero informs the interface that the value is unspecified. The image in the formats of <a href="#">VX_DF_IMAGE_NV12</a> , <a href="#">VX_DF_IMAGE_NV21</a> , <a href="#">VX_DF_IMAGE_IYUV</a> must have even height [R00525].                                                                     |
| in | <i>color</i>  | The <a href="#">VX_DF_IMAGE</a> ( <a href="#">Image Type Constants</a> ) code that represents the format of the image and the color space [R00526]. A value of <a href="#">VX_DF_IMAGE_VIRT</a> informs the interface that the format is unspecified [R00527].                                                                                          |

#### Returns

An image reference [vx\\_image](#). Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [R00528].

#### Note

Passing this reference to [vxMapImagePatch](#) will return an error [R00529].

### vxCreateImageFromHandle()

```

vx_image VX_API_CALL vxCreateImageFromHandle (
 vx_context context,
 vx_df_image color,
 const vx_imagepatch_addressing_t addrs[],
 void *const ptrs[],
 vx_enum memory_type)

```

Creates a reference to an image object that was externally allocated.

#### Parameters

|    |                    |                                                                                                                                                                                          |
|----|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>     | The reference to the implementation context [R00530].                                                                                                                                    |
| in | <i>color</i>       | See the <a href="#">Image Type Constants</a> codes. This mandates the number of planes needed to be valid in the <i>addrs</i> and <i>ptrs</i> arrays based on the format given [R00531]. |
| in | <i>addrs[]</i>     | The array of image patch addressing structures that define the dimension and stride of the array of pointers [R00532]. See note below.                                                   |
| in | <i>ptrs[]</i>      | The array of platform-defined references to each plane [R00533]. See note below.                                                                                                         |
| in | <i>memory_type</i> | <a href="#">Memory import type constants</a> .. When giving <a href="#">VX_MEMORY_TYPE_HOST</a> the <i>ptrs</i> array is assumed to be HOST accessible pointers to memory [R00534].      |

## Returns

An image reference `vx_image` [R00535]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00536].

## Note

The user must call `vxMapImagePatch` prior to accessing the pixels of an image, even if the image was created via `vxCreateImageFromHandle`. Reads or writes to memory referenced by `ptrs[ ]` after calling `vxCreateImageFromHandle` without first calling `vxMapImagePatch` will result in implementation-dependent behavior and should be avoided. The property of `addr[ ]` and `ptrs[ ]` arrays is kept by the caller (It means that the implementation will make an internal copy of the provided information. `addr` and `ptrs` can then simply be application's local variables) [R00537]. Only `dim_x`, `dim_y`, `stride_x` and `stride_y` fields of the `vx_imagepatch_addressing_t` need to be provided by the application. Other fields (`step_x`, `step_y`, `scale_x` & `scale_y`) are ignored by this function [R00538]. The layout of the imported memory must follow a row-major order. In other words, `stride_x` should be sufficiently large so that there is no overlap between data elements corresponding to different pixels, and `stride_y`  $\geq$  `stride_x` \* `dim_x`.

In order to release the image back to the application we should use `vxSwapImageHandle`.

Import type of the created image is available via the image attribute `The Image Attributes Constants` parameter [R00539].

**vxSwapImageHandle()**

```
vx_status VX_API_CALL vxSwapImageHandle (
 vx_image image,
 void *const new_ptrs[],
 void * prev_ptrs[],
 vx_size num_planes)
```

Swaps the image handle of an image previously created from handle.

This function sets the new image handle (i.e. pointer to all image planes) and returns the previous one [R00540].

Once this function call has completed, the application gets back the ownership of the memory referenced by the previous handle. This memory contains up-to-date pixel data [R00541], and the application can safely reuse or release it.

The memory referenced by the new handle must have been allocated consistently with the image properties since the import type, memory layout and dimensions are unchanged (see `addr`s, `color`, and `memory_type` in `vxCreateImageFromHandle`).

All images created from ROI or channel with this image as parent or ancestor will automatically use the memory referenced by the new handle [R00542].

The behavior of `vxSwapImageHandle` when called from a user node is implementation dependant.

## Parameters

|     |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <code>image</code>        | The reference to an image created from handle [R00543]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| in  | <code>new_ptrs[ ]</code>  | <p>pointer to a caller owned array that contains the new image handle (image plane pointers)</p> <ul style="list-style-type: none"> <li><code>new_ptrs</code> is non NULL. <code>new_ptrs[i]</code> must be non NULL for each <code>i</code> such as <math>0 &lt; i &lt; \text{nbPlanes}</math>, otherwise, this is an error [R00544]. The address of the storage memory for image plane <code>i</code> is set to <code>new_ptrs[i]</code> [R00545]</li> <li><code>new_ptrs</code> is NULL: the previous image storage memory is reclaimed by the caller, while no new handle is provided [R00546].</li> </ul> |
| out | <code>prev_ptrs[ ]</code> | <p>pointer to a caller owned array in which the application returns the previous image handle</p> <ul style="list-style-type: none"> <li><code>prev_ptrs</code> is non NULL. <code>prev_ptrs</code> must have at least as many elements as the number of image planes. For each <code>i</code> such as <math>0 &lt; i &lt; \text{nbPlanes}</math>, <code>prev_ptrs[i]</code> is set to the address of the previous storage memory for plane <code>i</code> [R00547].</li> <li><code>prev_ptrs</code> NULL: the previous handle is not returned [R00548].</li> </ul>                                            |

**Parameters**

|    |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>num_planes</i> | Number of planes in the image [R00549]. This must be set equal to the number of planes of the input image. The number of elements in <i>new_ptr</i> s and <i>prev_ptr</i> s arrays must be equal to or greater than <i>num_planes</i> . If either array has more than <i>num_planes</i> elements, the extra elements are ignored. If either array is smaller than <i>num_planes</i> , the results are implementation-dependent. |
|----|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

A The *vx\_status* Constants value.

**Return values**

|                                    |                                                                                                 |
|------------------------------------|-------------------------------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00550].                                          |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | image is not a valid <i>vx_image</i> reference. reference.                                      |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | The image was not created from handle or the content of <i>new_ptr</i> s is not valid [R00551]. |
| <i>VX_FAILURE</i>                  | The image was already being accessed [R00552].                                                  |

**vxQueryImage()**

```
vx_status VX_API_CALL vxQueryImage (
 vx_image image,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Retrieves various attributes of an image.

**Parameters**

|     |                  |                                                                         |
|-----|------------------|-------------------------------------------------------------------------|
| in  | <i>image</i>     | The reference to the image to query [R00553].                           |
| in  | <i>attribute</i> | The attribute to query. Use a The Image Attributes Constants [R00554].  |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00555].            |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R00556]. |

**Returns**

A The *vx\_status* Constants value.

**Return values**

|                                    |                                                           |
|------------------------------------|-----------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00557].    |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | image is not a valid <i>vx_image</i> reference.           |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | If any of the other parameters are incorrect.             |
| <i>VX_ERROR_NOT_SUPPORTED</i>      | If the attribute is not supported on this implementation. |

**vxSetImageAttribute()**

```
vx_status VX_API_CALL vxSetImageAttribute (
```

```

vx_image image,
vx_enum attribute,
const void * ptr,
vx_size size)

```

Allows setting attributes on the image.

#### Parameters

|    |                  |                                                                                            |
|----|------------------|--------------------------------------------------------------------------------------------|
| in | <i>image</i>     | The reference to the image on which to set the attribute [R00558].                         |
| in | <i>attribute</i> | The attribute to set. Use a <a href="#">The Image Attributes Constants</a> value [R00559]. |
| in | <i>ptr</i>       | The pointer to the location from which to read the value [R00560].                         |
| in | <i>size</i>      | The size in bytes of the object pointed to by <i>ptr</i> [R00561].                         |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                    |                                                          |
|------------------------------------|----------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00562].   |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | image is not a valid <a href="#">vx_image</a> reference. |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | If any of the other parameters are incorrect.            |

### vxReleaseImage()

```

vx_status VX_API_CALL vxReleaseImage (
 vx_image * image)

```

Releases a reference to an image object. The object may not be garbage collected until its total reference count is zero.

An implementation may defer the actual object destruction after its total reference count is zero (potentially until context destruction). Thus, releasing an image created from handle (see [vxCreateImageFromHandle](#)) and all others objects that may reference it (nodes, ROI, or channel for instance) are not sufficient to get back the ownership of the memory referenced by the current image handle. The only way for this is to call [vxSwapImageHandle](#) before releasing the image.

#### Parameters

|    |              |                                               |
|----|--------------|-----------------------------------------------|
| in | <i>image</i> | The pointer to the image to release [R00563]. |
|----|--------------|-----------------------------------------------|

#### Postcondition

After returning from this function the reference is zeroed [R00564].

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                   |                                                          |
|-----------------------------------|----------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R00565].   |
| <i>VX_ERROR_INVALID_REFERENCE</i> | image is not a valid <a href="#">vx_image</a> reference. |

**vxComputeImagePatchSize()**

```
vx_size VX_API_CALL vxComputeImagePatchSize (
 vx_image image,
 const vx_rectangle_t * rect,
 vx_uint32 plane_index)
```

This computes the size needed to retrieve an image patch from an image.

**Parameters**

|    |                    |                                                                                                                                             |
|----|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>image</i>       | The reference to the image from which to extract the patch [R00566].                                                                        |
| in | <i>rect</i>        | The coordinates. Must be $0 \leq \text{start} < \text{end} \leq \text{dimension}$ where dimension is width for x and height for y [R00567]. |
| in | <i>plane_index</i> | The plane index from which to get the data [R00568].                                                                                        |

**Returns**

vx\_size the size needed to retrieve an image patch from an image [R00569] or zero in the case of error [R00570].

**vxFormatImagePatchAddress1d()**

```
void* VX_API_CALL vxFormatImagePatchAddress1d (
 void * ptr,
 vx_uint32 index,
 const vx_imagepatch_addressing_t * addr)
```

Accesses a specific indexed pixel in an image patch.

**Parameters**

|    |              |                                                                                                                                  |
|----|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| in | <i>ptr</i>   | The base pointer of the patch as returned from <code>vxMapImagePatch</code> [R00571].                                            |
| in | <i>index</i> | The 0 based index of the pixel count in the patch. Indexes increase horizontally by 1 then wrap around to the next row [R00572]. |
| in | <i>addr</i>  | The pointer to the addressing mode information returned from <code>vxMapImagePatch</code> [R00573].                              |

**Returns**

void \* Returns the pointer to the specified pixel or NULL in the case of error [R00574].

**Precondition**

`vxMapImagePatch`

**vxFormatImagePatchAddress2d()**

```
void* VX_API_CALL vxFormatImagePatchAddress2d (
 void * ptr,
 vx_uint32 x,
 vx_uint32 y,
 const vx_imagepatch_addressing_t * addr)
```

Accesses a specific pixel at a 2d coordinate in an image patch.

**Parameters**

|    |             |                                                                                                        |
|----|-------------|--------------------------------------------------------------------------------------------------------|
| in | <i>ptr</i>  | The base pointer of the patch as returned from <a href="#">vxMapImagePatch</a> [R00575].               |
| in | <i>x</i>    | The x dimension within the patch [R00576].                                                             |
| in | <i>y</i>    | The y dimension within the patch [R00577].                                                             |
| in | <i>addr</i> | The pointer to the addressing mode information returned from <a href="#">vxMapImagePatch</a> [R00578]. |

**Returns**

void \* Returns the pointer to the specified pixel or NULL in the case of error [R00579].

**Precondition**

[vxMapImagePatch](#)

**vxGetValidRegionImage()**

```
vx_status VX_API_CALL vxGetValidRegionImage (
 vx_image image,
 vx_rectangle_t * rect)
```

Retrieves the valid region of the image as a rectangle.

**Parameters**

|     |              |                                                             |
|-----|--------------|-------------------------------------------------------------|
| in  | <i>image</i> | The image from which to retrieve the valid region [R00580]. |
| out | <i>rect</i>  | The destination rectangle [R00581].                         |

**Returns**

A The [vx\\_status Constants](#) value.

**Return values**

|                                             |                                                          |
|---------------------------------------------|----------------------------------------------------------|
| <a href="#">VX_SUCCESS</a>                  | No errors; any other value indicates failure [R00582].   |
| <a href="#">VX_ERROR_INVALID_REFERENCE</a>  | image is not a valid <a href="#">vx_image</a> reference. |
| <a href="#">VX_ERROR_INVALID_PARAMETERS</a> | Invalid rect.                                            |

**Note**

This rectangle can be passed directly to [vxMapImagePatch](#) to get the full valid region of the image.

**vxCopyImagePatch()**

```
vx_status VX_API_CALL vxCopyImagePatch (
 vx_image image,
 const vx_rectangle_t * image_rect,
 vx_uint32 image_plane_index,
 const vx_imagepatch_addressing_t * user_addr,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy a rectangular patch from/into an image object plane.

## Parameters

|    |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>image</i>             | The reference to the image object that is the source or the destination of the copy [R00583].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| in | <i>image_rect</i>        | The coordinates of the image patch. The patch must be within the bounds of the image [R00584]. (start_x, start_y) gives the coordinates of the topleft pixel inside the patch, while (end_x, end_y) gives the coordinates of the bottomright element out of the patch. Must be $0 \leq \text{start} < \text{end} \leq \text{number of pixels in the image dimension}$ [R00585].                                                                                                                                                                                                       |
| in | <i>image_plane_index</i> | The plane index of the image object that is the source or the destination of the patch copy [R00586].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| in | <i>user_addr</i>         | The address of a structure describing the layout of the user memory location pointed by user_ptr. In the structure, only dim_x, dim_y, stride_x and stride_y fields must be provided, other fields are ignored by the function [R00587]. The layout of the user memory must follow a row major order: stride_x $\geq$ pixel size in bytes, and stride_y $\geq$ stride_x * dim_x [R00588].                                                                                                                                                                                             |
| in | <i>user_ptr</i>          | The address of the memory location where to store the requested data if the copy was requested in read mode, or from where to get the data to store into the image object if the copy was requested in write mode [R00589]. The accessible memory must be large enough to contain the specified patch with the specified layout: accessible memory in bytes $\geq (\text{end\_y} - \text{start\_y}) * \text{stride\_y}$ [R00590].                                                                                                                                                     |
| in | <i>usage</i>             | This declares the effect of the copy with regard to the image object using the <a href="#">The memory accessor hint flags</a> . value [R00591]. For uniform images, only VX_READ_ONLY is supported [R00592]. For other images, Only VX_READ_ONLY and VX_WRITE_ONLY are supported: <ul style="list-style-type: none"> <li>• <a href="#">VX_READ_ONLY</a> means that data is copied from the image object into the application memory [R00593]</li> <li>• <a href="#">VX_WRITE_ONLY</a> means that data is copied into the image object from the application memory [R00594]</li> </ul> |
| in | <i>user_mem_type</i>     | A <a href="#">Memory import type constants</a> . value that specifies the memory type of the memory referenced by the user_addr [R00595].                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                             |                                                                                    |
|---------------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">VX_SUCCESS</a>                  | No errors; any other value indicates failure [R00596].                             |
| <a href="#">VX_ERROR_OPTIMIZED_AWAY</a>     | This is a reference to a virtual image that cannot be accessed by the application. |
| <a href="#">VX_ERROR_INVALID_REFERENCE</a>  | image is not a valid <a href="#">vx_image</a> reference.                           |
| <a href="#">VX_ERROR_INVALID_PARAMETERS</a> | An other parameter is incorrect.                                                   |

## Note

The application may ask for data outside the bounds of the valid region, but such data has an implementation-dependent value.

**vxMapImagePatch()**

```
vx_status VX_API_CALL vxMapImagePatch (
```

```

vx_image image,
const vx_rectangle_t * rect,
vx_uint32 plane_index,
vx_map_id * map_id,
vx_imagepatch_addressing_t * addr,
void ** ptr,
vx_enum usage,
vx_enum mem_type,
vx_uint32 flags)

```

Allows the application to get direct access to a rectangular patch of an image object plane.

#### Parameters

|     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>image</i>       | The reference to the image object that contains the patch to map [R00597].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| in  | <i>rect</i>        | The coordinates of image patch. The patch must be within the bounds of the image [R00598]. (start_x, start_y) gives the coordinate of the topleft element inside the patch, while (end_x, end_y) give the coordinate of the bottomright element out of the patch. Must be 0 ≤ start < end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| in  | <i>plane_index</i> | The plane index of the image object to be accessed [R00599].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| out | <i>map_id</i>      | <p>The address of a <code>vx_map_id</code> variable where the function returns a map identifier [R00600].</p> <ul style="list-style-type: none"> <li>• (*map_id) must eventually be provided as the map_id parameter of a call to <code>vxUnmapImagePatch</code>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| out | <i>addr</i>        | The address of a structure describing the memory layout of the image patch to access [R00601]. The function fills the structure pointed by addr with the layout information that the application must consult to access the pixel data at address (*ptr) [R00602]. The layout of the mapped memory follows a row-major order: stride_x>0, stride_y>0 and stride_y ≥ stride_x * dim_x [R00603]. If the image object being accessed was created via <code>vxCreateImageFromHandle</code> , then the returned memory layout will be the identical to that of the addressing structure provided when <code>vxCreateImageFromHandle</code> was called [R00604].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| out | <i>ptr</i>         | The address of a pointer that the function sets to the address where the requested data can be accessed [R00605]. This returned (*ptr) address is only valid between the call to this function and the corresponding call to <code>vxUnmapImagePatch</code> . If image was created via <code>vxCreateImageFromHandle</code> then the returned address (*ptr) will be the address of the patch in the original pixel buffer provided when image was created [R00606].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| in  | <i>usage</i>       | <p>This declares the access mode for the image patch [R00607]. For uniform images, only VX_READ_ONLY is supported [R00608].</p> <ul style="list-style-type: none"> <li>• <code>VX_READ_ONLY</code>: after the function call, the content of the memory location pointed by (*ptr) contains the image patch data [R00609]. Writing into this memory location is forbidden.</li> <li>• <code>VX_READ_AND_WRITE</code>: after the function call, the content of the memory location pointed by (*ptr) contains the image patch data; writing into this memory is allowed only for the location of pixels only and will result in a modification of the written pixels in the image object once the patch is unmapped [R00610]. Writing into a gap between pixels (when addr-&gt;stride_x &gt; pixel size in bytes or addr-&gt;stride_y &gt; addr-&gt;stride_x*addr-&gt;dim_x) is forbidden.</li> <li>• <code>VX_WRITE_ONLY</code>: after the function call, the memory location pointed by (*ptr) contains arbitrary data; writing each pixel of the patch is required prior to unmapping. Pixels not written by the application before unmap will become implementation-dependent after unmap, even if they were well defined before map. Like for VX_READ_AND_WRITE, writing into a gap between pixels is forbidden and its behavior is implementation-dependent.</li> </ul> |

**Parameters**

|    |                 |                                                                                                                                                        |
|----|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>mem_type</i> | A <a href="#">Memory import type constants</a> . value that specifies the type of the memory where the image patch is requested to be mapped [R00611]. |
| in | <i>flags</i>    | An integer that allows passing options to the map operation [R00612]. Use the <a href="#">The Map/Unmap flag</a> value.                                |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                    |                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00613].                             |
| <i>VX_ERROR_OPTIMIZED_AWAY</i>     | This is a reference to a virtual image that cannot be accessed by the application. |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | image is not a valid <a href="#">vx_image</a> reference. reference.                |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | An other parameter is incorrect.                                                   |

**Note**

The user may ask for data outside the bounds of the valid region, but such data has an implementation-dependent value.

**Postcondition**

[vxUnmapImagePatch](#) with same (\*map\_id) value.

**vxUnmapImagePatch()**

```
vx_status VX_API_CALL vxUnmapImagePatch (
 vx_image image,
 vx_map_id map_id)
```

Unmap and commit potential changes to a image object patch that were previously mapped. Unmapping an image patch invalidates the memory location from which the patch could be accessed by the application. Accessing this memory location after the unmap function completes has an implementation-dependent behavior.

**Parameters**

|     |               |                                                                                          |
|-----|---------------|------------------------------------------------------------------------------------------|
| in  | <i>image</i>  | The reference to the image object to unmap [R00614].                                     |
| out | <i>map_id</i> | The unique map identifier that was returned by <a href="#">vxMapImagePatch</a> [R00615]. |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                    |                                                          |
|------------------------------------|----------------------------------------------------------|
| <i>VX_SUCCESS</i>                  | No errors; any other value indicates failure [R00616].   |
| <i>VX_ERROR_INVALID_REFERENCE</i>  | image is not a valid <a href="#">vx_image</a> reference. |
| <i>VX_ERROR_INVALID_PARAMETERS</i> | An other parameter is incorrect.                         |

Precondition

`vxMapImagePatch` with same `map_id` value

### **vxCreateImageFromChannel()**

```
vx_image VX_API_CALL vxCreateImageFromChannel (
 vx_image img,
 vx_enum channel)
```

Create a sub-image from a single plane channel of another image.

The sub-image refers to the data in the original image [R00617]. Updates to this image update the parent image and conversely [R00618].

The function supports channels that occupy an entire plane of a multi-planar images, as listed below. Other cases are not supported. `VX_CHANNEL_Y` from YUV4 [R00619], `IYUV` [R00620], `NV12` [R00621], `NV21` [R00622] `VX_CHANNEL_U` from YUV4 [R00623], `IYUV` [R00624] `VX_CHANNEL_V` from YUV4 [R00625], `IYUV` [R00626]

#### Parameters

|    |                |                                             |
|----|----------------|---------------------------------------------|
| in | <i>img</i>     | The reference to the parent image [R00627]. |
| in | <i>channel</i> | The channel to use [R00628].                |

#### Returns

An image reference `vx_image` to the sub-image [R00629]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00630].

### **vxSetImageValidRectangle()**

```
vx_status VX_API_CALL vxSetImageValidRectangle (
 vx_image image,
 const vx_rectangle_t * rect)
```

Sets the valid rectangle for an image according to a supplied rectangle.

#### Note

Setting or changing the valid region from within a user node by means other than the call-back, for example by calling `vxSetImageValidRectangle`, might result in an incorrect valid region calculation by the framework.

#### Parameters

|    |              |                                                                                                                                 |
|----|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| in | <i>image</i> | The reference to the image [R00631].                                                                                            |
| in | <i>rect</i>  | The value to be set to the image valid rectangle [R00632]. A NULL indicates that the valid region is the entire image [R00633]. |

#### Returns

A The `vx_status Constants` value.

#### Return values

|                                          |                                                        |
|------------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00634]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | image is not a valid <code>vx_image</code> reference.  |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | The rect does not define a proper valid rectangle.     |

## 3.55 Object: LUT

### 3.55.1 Detailed Description

Defines the Look-Up Table Interface.

A lookup table is an array that simplifies run-time computation by replacing computation with a simpler array indexing operation.

#### Modules

- [The Look-Up Table \(LUT\) attribute list.](#)

*The Look-Up Table (LUT) attribute list.*

#### Typedefs

- `typedef struct _vx_lut * vx_lut`

*The Look-Up Table (LUT) Object.*

#### Functions

- `vx_status VX_API_CALL vxCopyLUT (vx_lut lut, void *user_ptr, vx_enum usage, vx_enum user_mem_type)`  
*Allows the application to copy from/into a LUT object [R00953].*
- `vx_lut VX_API_CALL vxCreateLUT (vx_context context, vx_enum data_type, vx_size count)`  
*Creates LUT object of a given type [R00933]. The value of `VX_LUT_OFFSET` is equal to 0 for `data_type = VX_TYPE_UINT8`, and `(vx_uint32)(count/2)` for `VX_TYPE_INT16` [R00934].*
- `vx_status VX_API_CALL vxMapLUT (vx_lut lut, vx_map_id *map_id, void **ptr, vx_enum usage, vx_enum mem_type, vx_bitfield flags)`  
*Allows the application to get direct access to LUT object [R00962].*
- `vx_status VX_API_CALL vxQueryLUT (vx_lut lut, vx_enum attribute, void *ptr, vx_size size)`  
*Queries attributes from a LUT [R00947].*
- `vx_status VX_API_CALL vxReleaseLUT (vx_lut *lut)`  
*Releases a reference to a LUT object [R00943]. The object may not be garbage collected until its total reference count is zero.*
- `vx_status VX_API_CALL vxUnmapLUT (vx_lut lut, vx_map_id map_id)`  
*Unmap and commit potential changes to LUT object that was previously mapped [R00977]. Unmapping a LUT invalidates the memory location from which the LUT data could be accessed by the application. Accessing this memory location after the unmap function completes has implementation-dependent behavior.*

### 3.55.2 Function Documentation

#### vxCreateLUT()

```
vx_lut VX_API_CALL vxCreateLUT (
 vx_context context,
 vx_enum data_type,
 vx_size count)
```

Creates LUT object of a given type [R00933]. The value of `VX_LUT_OFFSET` is equal to 0 for `data_type = VX_TYPE_UINT8`, and `(vx_uint32)(count/2)` for `VX_TYPE_INT16` [R00934].

#### Parameters

|    |                  |                                                                                                                                                   |
|----|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The reference to the context [R00935].                                                                                                            |
| in | <i>data_type</i> | The type of data stored in the LUT [R00936]. The <code>data_type</code> can be <code>VX_TYPE_UINT8</code> or <code>VX_TYPE_INT16</code> [R00937]. |
| in | <i>count</i>     | The number of entries desired [R00938].                                                                                                           |

**Note**

If `data_type` is `VX_TYPE_UINT8`, count should be less than or equal to 256 [R00939]. If `data_type` is `VX_TYPE_INT16`, count should be less than or equal to 65536 [R00940].

**Returns**

An LUT reference `vx_lut` [R00941]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00942].

**vxReleaseLUT()**

```
vx_status VX_API_CALL vxReleaseLUT (
 vx_lut * lut)
```

Releases a reference to a LUT object [R00943]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |            |                                             |
|----|------------|---------------------------------------------|
| in | <i>lut</i> | The pointer to the LUT to release [R00944]. |
|----|------------|---------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R00945].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                                |
|-----------------------------------------|----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00946].         |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <code>lut</code> is not a valid <code>vx_lut</code> reference. |

**vxQueryLUT()**

```
vx_status VX_API_CALL vxQueryLUT (
 vx_lut lut,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries attributes from a LUT [R00947].

**Parameters**

|     |                  |                                                                                       |
|-----|------------------|---------------------------------------------------------------------------------------|
| in  | <i>lut</i>       | The LUT to query [R00948].                                                            |
| in  | <i>attribute</i> | The attribute to query. Use a The Look-Up Table (LUT) attribute list. value [R00949]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00950].                          |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R00951].               |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00952</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | lut is not a valid <a href="#">vx_lut</a> reference.            |

**vxCopyLUT()**

```
vx_status VX_API_CALL vxCopyLUT (
 vx_lut lut,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy from/into a LUT object [*R00953*].

## Parameters

|    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>lut</i>           | The reference to the LUT object that is the source or the destination of the copy [ <i>R00954</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| in | <i>user_ptr</i>      | The address of the memory location where to store the requested data if the copy was requested in read mode, or from where to get the data to store into the LUT object if the copy was requested in write mode [ <i>R00955</i> ]. In the user memory, the LUT is represented as a array with elements of the type corresponding to <a href="#">VX_LUT_TYPE</a> , and with a number of elements equal to the value returned via <a href="#">VX_LUT_COUNT</a> [ <i>R00956</i> ]. The accessible memory must be large enough to contain this array: accessible memory in bytes $\geq \text{sizeof}(\text{data\_element}) * \text{count}$ . |
| in | <i>usage</i>         | This declares the effect of the copy with regard to the LUT object using the <a href="#">The memory accessor hint flags.</a> value. Only <a href="#">VX_READ_ONLY</a> and <a href="#">VX_WRITE_ONLY</a> are supported [ <i>R00957</i> ]: <ul style="list-style-type: none"> <li><a href="#">VX_READ_ONLY</a> means that data are copied from the LUT object into the user memory [<i>R00958</i>].</li> <li><a href="#">VX_WRITE_ONLY</a> means that data are copied into the LUT object from the user memory [<i>R00959</i>].</li> </ul>                                                                                                 |
| in | <i>user_mem_type</i> | A <a href="#">Memory import type constants.</a> value that specifies the memory type of the memory referenced by the <i>user_addr</i> [ <i>R00960</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                          |                                                                 |
|------------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [ <i>R00961</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | lut is not a valid <a href="#">vx_lut</a> reference.            |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                |

**vxMapLUT()**

```

vx_status VX_API_CALL vxMapLUT (
 vx_lut lut,
 vx_map_id * map_id,
 void ** ptr,
 vx_enum usage,
 vx_enum mem_type,
 vx_bitfield flags)

```

Allows the application to get direct access to LUT object [R00962].

**Parameters**

|     |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>lut</i>      | The reference to the LUT object to map [R00963].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| out | <i>map_id</i>   | The address of a <code>vx_map_id</code> variable where the function returns a map identifier [R00964]. <ul style="list-style-type: none"> <li>• (*map_id) must eventually be provided as the map_id parameter of a call to <code>vxUnmapLUT</code> [R00965].</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| out | <i>ptr</i>      | The address of a pointer that the function sets to the address where the requested data can be accessed [R00966]. In the mapped memory area, the LUT data are structured as an array with elements of the type corresponding to <code>VX_LUT_TYPE</code> , with a number of elements equal to the value returned via <code>VX_LUT_COUNT</code> [R00967]. Accessing the memory out of the bound of this array is forbidden and has implementation-dependent behavior. The returned (*ptr) address is valid between the call to the function and the corresponding call to <code>vxUnmapLUT</code> [R00968].                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| in  | <i>usage</i>    | This declares the access mode for the LUT [R00969]. <ul style="list-style-type: none"> <li>• <code>VX_READ_ONLY</code>: after the function call, the content of the memory location pointed by (*ptr) contains the LUT data [R00970]. Writing into this memory location is forbidden and its behavior is implementation-dependent.</li> <li>• <code>VX_READ_AND_WRITE</code>: after the function call, the content of the memory location pointed by (*ptr) contains the LUT data [R00971]; writing into this memory is allowed only for the location of entries and will result in a modification of the affected entries in the LUT object once the LUT is unmapped [R00972].</li> <li>• <code>VX_WRITE_ONLY</code>: after the function call, the data at memory location pointed by (*ptr) is implementation-dependent; writing each entry of LUT is required prior to unmapping. Entries not written by the application before unmap will become implementation-dependent after unmap, even if they were well defined before map.</li> </ul> |
| in  | <i>mem_type</i> | A <code>Memory import type constants</code> . value that specifies the type of the memory where the LUT is requested to be mapped [R00973].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in  | <i>flags</i>    | An integer that allows passing options to the map operation [R00974]. Use 0 for this option [R00975].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                        |
|------------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00976]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | lut is not a valid <code>vx_lut</code> reference.      |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                       |

Postcondition

`vxUnmapLUT` with same (`*map_id`) value.

### `vxUnmapLUT()`

```
vx_status VX_API_CALL vxUnmapLUT (
 vx_lut lut,
 vx_map_id map_id)
```

Unmap and commit potential changes to LUT object that was previously mapped [R00977]. Unmapping a LUT invalidates the memory location from which the LUT data could be accessed by the application. Accessing this memory location after the unmap function completes has implementation-dependent behavior.

#### Parameters

|     |                     |                                                                                          |
|-----|---------------------|------------------------------------------------------------------------------------------|
| in  | <code>lut</code>    | The reference to the LUT object to unmap [R00978].                                       |
| out | <code>map_id</code> | The unique map identifier that was returned when calling <code>vxMapLUT</code> [R00979]. |

#### Returns

A The `vx_status Constants` value.

#### Return values

|                                          |                                                        |
|------------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00980]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | lut is not a valid <code>vx_lut</code> reference.      |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                       |

#### Precondition

`vxMapLUT` returning the same `map_id` value [R00981].

## 3.56 Object: Matrix

### 3.56.1 Detailed Description

Defines the Matrix Object Interface.

#### Modules

- [The matrix attributes.](#)

*The matrix attributes.*

#### Typedefs

- typedef struct \_vx\_matrix \* [vx\\_matrix](#)

*The Matrix Object. An MxN matrix of some unit type.*

#### Functions

- [vx\\_status VX\\_API\\_CALL vxCopyMatrix](#) ([vx\\_matrix](#) matrix, void \*[user\\_ptr](#), [vx\\_enum](#) usage, [vx\\_enum](#) [user\\_mem\\_type](#))  
*Allows the application to copy from/into a matrix object [R01064].*
- [vx\\_matrix VX\\_API\\_CALL vxCreateMatrix](#) ([vx\\_context](#) context, [vx\\_enum](#) data\_type, [vx\\_size](#) columns, [vx\\_size](#) rows)  
*Creates a reference to a matrix object [R01050].*
- [vx\\_matrix VX\\_API\\_CALL vxCreateMatrixFromPattern](#) ([vx\\_context](#) context, [vx\\_enum](#) pattern, [vx\\_size](#) columns, [vx\\_size](#) rows)  
*Creates a reference to a matrix object from a boolean pattern [R01074].*
- [vx\\_status VX\\_API\\_CALL vxQueryMatrix](#) ([vx\\_matrix](#) mat, [vx\\_enum](#) attribute, void \*[ptr](#), [vx\\_size](#) size)  
*Queries an attribute on the matrix object.*
- [vx\\_status VX\\_API\\_CALL vxReleaseMatrix](#) ([vx\\_matrix](#) \*mat)  
*Releases a reference to a matrix object [R01056]. The object may not be garbage collected until its total reference count is zero.*

### 3.56.2 Function Documentation

#### vxCreateMatrix()

```
vx_matrix VX_API_CALL vxCreateMatrix (
 vx_context context,
 vx_enum data_type,
 vx_size columns,
 vx_size rows)
```

Creates a reference to a matrix object [R01050].

#### Parameters

|    |                  |                                                                                                                                            |
|----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The reference to the overall context [R01051].                                                                                             |
| in | <i>data_type</i> | The unit format of the matrix: <a href="#">VX_TYPE_UINT8</a> or <a href="#">VX_TYPE_INT32</a> or <a href="#">VX_TYPE_FLOAT32</a> [R01052]. |
| in | <i>columns</i>   | The first dimensionality [R01053].                                                                                                         |
| in | <i>rows</i>      | The second dimensionality [R01054].                                                                                                        |

## Returns

An matrix reference `vx_matrix`. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R01055].

**vxReleaseMatrix()**

```
vx_status VX_API_CALL vxReleaseMatrix (
 vx_matrix * mat)
```

Releases a reference to a matrix object [R01056]. The object may not be garbage collected until its total reference count is zero.

## Parameters

|    |            |                                           |
|----|------------|-------------------------------------------|
| in | <i>mat</i> | The matrix reference to release [R01057]. |
|----|------------|-------------------------------------------|

## Postcondition

After returning from this function the reference is zeroed.

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01058]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | mat is not a valid <code>vx_matrix</code> reference.   |

**vxQueryMatrix()**

```
vx_status VX_API_CALL vxQueryMatrix (
 vx_matrix mat,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries an attribute on the matrix object.

## Parameters

|     |                  |                                                                                    |
|-----|------------------|------------------------------------------------------------------------------------|
| in  | <i>mat</i>       | The matrix object to set [R01059].                                                 |
| in  | <i>attribute</i> | The attribute to query. Use a The <code>matrix attributes</code> . value [R01060]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01061].                       |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01062].            |

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01063]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | mat is not a valid <code>vx_matrix</code> reference.   |

**vxCopyMatrix()**

```
vx_status VX_API_CALL vxCopyMatrix (
 vx_matrix matrix,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy from/into a matrix object [R01064].

**Parameters**

|    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>matrix</i>        | The reference to the matrix object that is the source or the destination of the copy [R01065].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in | <i>user_ptr</i>      | The address of the memory location where to store the requested data if the copy was requested in read mode, or from where to get the data to store into the matrix object if the copy was requested in write mode [R01066]. In the user memory, the matrix is structured as a row-major 2D array with elements of the type corresponding to <code>VX_MATRIX_TYPE</code> , with a number of rows corresponding to <code>VX_MATRIX_ROWS</code> and a number of columns corresponding to <code>VX_MATRIX_COLUMNS</code> [R01067]. The accessible memory must be large enough to contain this 2D array: accessible memory in bytes $\geq \text{sizeof}(\text{data\_element}) * \text{rows} * \text{columns}$ [R01068]. |
| in | <i>usage</i>         | This declares the effect of the copy with regard to the matrix object using the <code>The memory accessor hint flags</code> . value. Only <code>VX_READ_ONLY</code> and <code>VX_WRITE_ONLY</code> are supported [R01069]: <ul style="list-style-type: none"> <li>• <code>VX_READ_ONLY</code> means that data are copied from the matrix object into the user memory [R01070].</li> <li>• <code>VX_WRITE_ONLY</code> means that data are copied into the matrix object from the user memory [R01071].</li> </ul>                                                                                                                                                                                                    |
| in | <i>user_mem_type</i> | A <code>Memory import type constants</code> . value that specifies the memory type of the memory referenced by the <code>user_addr</code> [R01072].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Returns**

A `The vx_status Constants` value.

**Return values**

|                                          |                                                         |
|------------------------------------------|---------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01073].  |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | matrix is not a valid <code>vx_matrix</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                        |

**vxCreateMatrixFromPattern()**

```
vx_matrix VX_API_CALL vxCreateMatrixFromPattern (
 vx_context context,
 vx_enum pattern,
 vx_size columns,
 vx_size rows)
```

Creates a reference to a matrix object from a boolean pattern [R01074].

The matrix created by this function is of type `vx_uint8`, with the value 0 representing False, and the value 255 representing True [R01075]. It supports patterns described below. See [Matrix patterns](#).

- `VX_PATTERN_BOX` is a matrix with dimensions equal to the given number of rows and columns, and all cells equal to 255 [R01076]. Dimensions of 3x3 and 5x5 must be supported [R01077].
- `VX_PATTERN_CROSS` is a matrix with dimensions equal to the given number of rows and columns, which both must be odd numbers [R01078]. All cells in the center row and center column are equal to 255, and the rest are equal to zero [R01079]. Dimensions of 3x3 and 5x5 must be supported [R01080].
- `VX_PATTERN_DISK` is an  $R \times C$  matrix, where  $R$  and  $C$  are odd and cell  $(c, r)$  is 255 if:  
 $(r - R/2 + 0.5)^2 / (R/2)^2 + (c - C/2 + 0.5)^2 / (C/2)^2$  is less than or equal to 1,  
and 0 otherwise [R01081].
- `VX_PATTERN_OTHER` is any other pattern than the above (matrix created is still binary, with a value of 0 or 255) [R01082].

If the matrix was created via `vxCreateMatrixFromPattern`, this attribute must be set to the appropriate pattern enum. Otherwise the attribute must be set to `VX_PATTERN_OTHER`. The `vx_matrix` objects returned by this function are read-only [R01083]. The behavior when attempting to modify such a matrix is implementation-dependent.

#### Parameters

|    |                |                                                                         |
|----|----------------|-------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the overall context [R01084].                          |
| in | <i>pattern</i> | The pattern of the matrix. See <code>VX_MATRIX_PATTERN</code> [R01085]. |
| in | <i>columns</i> | The first dimensionality [R01086].                                      |
| in | <i>rows</i>    | The second dimensionality [R01087].                                     |

#### Returns

A matrix reference `vx_matrix` of type `vx_uint8` [R01088]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R01089].

## 3.57 Object: Pyramid

### 3.57.1 Detailed Description

Defines the Image Pyramid Object Interface.

A Pyramid object in OpenVX represents a collection of related images. Typically, these images are created by either downscaling or upscaling a *base image*, contained in level zero of the pyramid. Successive levels of the pyramid increase or decrease in size by a factor given by the `VX_PYRAMID_SCALE` attribute. For instance, in a pyramid with 3 levels and `VX_SCALE_PYRAMID_HALF`, the level one image is one-half the width and one-half the height of the level zero image, and the level two image is one-quarter the width and one quarter the height of the level zero image. When downscaling or upscaling results in a non-integral number of pixels at any level, fractional pixels always get rounded up to the nearest integer [R00125]. (E.g., a 3-level image pyramid beginning with level zero having a width of 9 and a scaling of `VX_SCALE_PYRAMID_HALF` results in the level one image with a width of  $5 = \text{ceil}(9 * 0.5)$  and a level two image with a width of  $3 = \text{ceil}(5 * 0.5)$ ). Position  $(r_N, c_N)$  at level  $N$  corresponds to position  $(r_{N-1}/\text{scale}, c_{N-1}/\text{scale})$  at level  $N - 1$ .

### Modules

- The pyramid object attributes.  
*The pyramid object attributes.*

### Macros

- `#define VX_SCALE_PYRAMID_HALF (0.5f)`  
*Use to indicate a half-scale pyramid.*
- `#define VX_SCALE_PYRAMID_ORB ((vx_float32)0.8408964f)`  
*Use to indicate a ORB scaled pyramid whose scaling factor is  $\frac{1}{\sqrt[3]{2}}$ .*

### Typedefs

- `typedef struct _vx_pyramid * vx_pyramid`  
*The Image Pyramid object. A set of scaled images.*

### Functions

- `vx_pyramid VX_API_CALL vxCreatePyramid (vx_context context, vx_size levels, vx_float32 scale, vx_uint32 width, vx_uint32 height, vx_df_image format)`  
*Creates a reference to a pyramid object of the supplied number of levels [R01122].*
- `vx_pyramid VX_API_CALL vxCreateVirtualPyramid (vx_graph graph, vx_size levels, vx_float32 scale, vx_uint32 width, vx_uint32 height, vx_df_image format)`  
*Creates a reference to a virtual pyramid object of the supplied number of levels [R01135].*
- `vx_image VX_API_CALL vxGetPyramidLevel (vx_pyramid pyr, vx_uint32 index)`  
*Retrieves a level of the pyramid as a `vx_image` [R01160], which can be used elsewhere in OpenVX. A call to `vxReleaseImage` is necessary to release an image for each call of `vxGetPyramidLevel` [R01161].*
- `vx_status VX_API_CALL vxQueryPyramid (vx_pyramid pyr, vx_enum attribute, void *ptr, vx_size size)`  
*Queries an attribute from an image pyramid [R01153].*
- `vx_status VX_API_CALL vxReleasePyramid (vx_pyramid *pyr)`  
*Releases a reference to a pyramid object [R01150]. The object may not be garbage collected until its total reference count is zero.*

### 3.57.2 Function Documentation

**vxCreatePyramid()**

```
vx_pyramid VX_API_CALL vxCreatePyramid (
 vx_context context,
 vx_size levels,
 vx_float32 scale,
 vx_uint32 width,
 vx_uint32 height,
 vx_df_image format)
```

Creates a reference to a pyramid object of the supplied number of levels [R01122].

**Parameters**

|    |                |                                                                                                                                                                                                                                   |
|----|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the overall context [R01123].                                                                                                                                                                                    |
| in | <i>levels</i>  | The number of levels desired [R01124]. This is required to be a non-zero value [R01125].                                                                                                                                          |
| in | <i>scale</i>   | Used to indicate the scale between pyramid levels [R01126]. This is required to be a non-zero positive value [R01127]. <a href="#">VX_SCALE_PYRAMID_HALF</a> and <a href="#">VX_SCALE_PYRAMID_ORB</a> must be supported [R01128]. |
| in | <i>width</i>   | The width of the 0th level image in pixels [R01129].                                                                                                                                                                              |
| in | <i>height</i>  | The height of the 0th level image in pixels [R01130].                                                                                                                                                                             |
| in | <i>format</i>  | The format of all images in the pyramid [R01131]. NV12, NV21, IYUV, UYVY and YUYV formats are not supported [R01132].                                                                                                             |

**Returns**

A pyramid reference [vx\\_pyramid](#) containing the sub-images [R01133]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [R01134].

**vxCreateVirtualPyramid()**

```
vx_pyramid VX_API_CALL vxCreateVirtualPyramid (
 vx_graph graph,
 vx_size levels,
 vx_float32 scale,
 vx_uint32 width,
 vx_uint32 height,
 vx_df_image format)
```

Creates a reference to a virtual pyramid object of the supplied number of levels [R01135].

Virtual Pyramids can be used to connect Nodes together when the contents of the pyramids will not be accessed by the user of the API. All of the following constructions are valid:

```
vx_context context = vxCreateContext();
vx_graph graph = vxCreateGraph(context);
vx_pyramid virt[] = {
 vxCreateVirtualPyramid(graph, 4, VX_SCALE_PYRAMID_HALF, 0, 0
 , VX_DF_IMAGE_VIRT), // no dimension and format specified for level 0
 vxCreateVirtualPyramid(graph, 4, VX_SCALE_PYRAMID_HALF, 640,
 480, VX_DF_IMAGE_VIRT), // no format specified.
 vxCreateVirtualPyramid(graph, 4, VX_SCALE_PYRAMID_HALF, 640,
 480, VX_DF_IMAGE_U8), // no access
};
```

**Parameters**

|    |               |                                                                                                                                                                                                                          |
|----|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>graph</i>  | The reference to the parent graph [R01136].                                                                                                                                                                              |
| in | <i>levels</i> | The number of levels desired [R01137]. This is required to be a non-zero value [R01138].                                                                                                                                 |
| in | <i>scale</i>  | Used to indicate the scale between pyramid levels. This is required to be a non-zero positive value [R01139]. <a href="#">VX_SCALE_PYRAMID_HALF</a> and <a href="#">VX_SCALE_PYRAMID_ORB</a> must be supported [R01140]. |

**Parameters**

|    |               |                                                                                                                                                         |
|----|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>width</i>  | The width of the 0th level image in pixels [R01141]. This may be set to zero to indicate to the interface that the value is unspecified [R01142].       |
| in | <i>height</i> | The height of the 0th level image in pixels [R01143]. This may be set to zero to indicate to the interface that the value is unspecified [R01144].      |
| in | <i>format</i> | The format of all images in the pyramid [R01145]. This may be set to <code>VX_DF_IMAGE_VIRT</code> to indicate that the format is unspecified [R01146]. |

**Returns**

A pyramid reference `vx_pyramid` [R01147]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R01148].

**Note**

Images extracted with `vxGetPyramidLevel` behave as Virtual Images and cause `vxMapImagePatch` to return errors [R01149].

**vxReleasePyramid()**

```
vx_status VX_API_CALL vxReleasePyramid (
 vx_pyramid * pyr)
```

Releases a reference to a pyramid object [R01150]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |            |                                                 |
|----|------------|-------------------------------------------------|
| in | <i>pyr</i> | The pointer to the pyramid to release [R01151]. |
|----|------------|-------------------------------------------------|

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                                    |
|-----------------------------------------|--------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01152].             |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <code>pyr</code> is not a valid <code>vx_pyramid</code> reference. |

**Postcondition**

After returning from this function the reference is zeroed.

**vxQueryPyramid()**

```
vx_status VX_API_CALL vxQueryPyramid (
 vx_pyramid pyr,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries an attribute from an image pyramid [R01153].

**Parameters**

|     |                  |                                                                                                                  |
|-----|------------------|------------------------------------------------------------------------------------------------------------------|
| in  | <i>pyr</i>       | The pyramid to query [R01154].                                                                                   |
| in  | <i>attribute</i> | The attribute for which to query [R01155]. Use a <a href="#">The pyramid object attributes</a> . value [R01156]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01157].                                                     |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01158].                                          |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                                 |
|-----------------------------------|-----------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01159].          |
| <i>VX_ERROR_INVALID_REFERENCE</i> | <i>pyr</i> is not a valid <a href="#">vx_pyramid</a> reference. |

**vxGetPyramidLevel()**

```
vx_image VX_API_CALL vxGetPyramidLevel (
 vx_pyramid pyr,
 vx_uint32 index)
```

Retrieves a level of the pyramid as a [vx\\_image](#) [R01160], which can be used elsewhere in OpenVX. A call to [vxReleaseImage](#) is necessary to release an image for each call of [vxGetPyramidLevel](#) [R01161].

**Parameters**

|    |              |                                                                       |
|----|--------------|-----------------------------------------------------------------------|
| in | <i>pyr</i>   | The pyramid object [R01162].                                          |
| in | <i>index</i> | The index of the level, such that index is less than levels [R01163]. |

**Returns**

A [vx\\_image](#) reference [R01164]. Any possible errors preventing a successful function completion should be checked using [vxGetStatus](#) [R01165].

## 3.58 Object: Remap

### 3.58.1 Detailed Description

Defines the Remap Object Interface.

#### Modules

- [The remap object attributes.](#)  
*The remap object attributes.*

#### Typedefs

- `typedef struct _vx_remap * vx_remap`  
*The remap table Object. A remap table contains per-pixel mapping of output pixels to input pixels.*

#### Functions

- `vx_remap VX_API_CALL vxCreateRemap (vx_context context, vx_uint32 src_width, vx_uint32 src_height, vx_uint32 dst_width, vx_uint32 dst_height)`  
*Creates a remap table object [R01166].*
- `vx_status VX_API_CALL vxGetRemapPoint (vx_remap table, vx_uint32 dst_x, vx_uint32 dst_y, vx_float32 *src_x, vx_float32 *src_y)`  
*Retrieves the source pixel point from a destination pixel [R01184].*
- `vx_status VX_API_CALL vxQueryRemap (vx_remap table, vx_enum attribute, void *ptr, vx_size size)`  
*Queries attributes from a Remap table [R01191].*
- `vx_status VX_API_CALL vxReleaseRemap (vx_remap *table)`  
*Releases a reference to a remap table object [R01173]. The object may not be garbage collected until its total reference count is zero.*
- `vx_status VX_API_CALL vxSetRemapPoint (vx_remap table, vx_uint32 dst_x, vx_uint32 dst_y, vx_float32 src_x, vx_float32 src_y)`  
*Assigns a destination pixel mapping to the source pixel [R01177].*

### 3.58.2 Function Documentation

#### vxCreateRemap()

```
vx_remap VX_API_CALL vxCreateRemap (
 vx_context context,
 vx_uint32 src_width,
 vx_uint32 src_height,
 vx_uint32 dst_width,
 vx_uint32 dst_height)
```

Creates a remap table object [R01166].

#### Parameters

|    |                   |                                                     |
|----|-------------------|-----------------------------------------------------|
| in | <i>context</i>    | The reference to the overall context [R01167].      |
| in | <i>src_width</i>  | Width of the source image in pixel [R01168].        |
| in | <i>src_height</i> | Height of the source image in pixels [R01169].      |
| in | <i>dst_width</i>  | Width of the destination image in pixels [R01170].  |
| in | <i>dst_height</i> | Height of the destination image in pixels [R01171]. |

**Returns**

A remap reference `vx_remap` [R01172]. Any possible errors preventing a successful creation should be checked using `vxGetStatus`.

**vxReleaseRemap()**

```
vx_status VX_API_CALL vxReleaseRemap (
 vx_remap * table)
```

Releases a reference to a remap table object [R01173]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |              |                                                     |
|----|--------------|-----------------------------------------------------|
| in | <i>table</i> | The pointer to the remap table to release [R01174]. |
|----|--------------|-----------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R01175].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01176]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | table is not a valid <code>vx_remap</code> reference.  |

**vxSetRemapPoint()**

```
vx_status VX_API_CALL vxSetRemapPoint (
 vx_remap table,
 vx_uint32 dst_x,
 vx_uint32 dst_y,
 vx_float32 src_x,
 vx_float32 src_y)
```

Assigns a destination pixel mapping to the source pixel [R01177].

**Parameters**

|    |                    |                                                                                  |
|----|--------------------|----------------------------------------------------------------------------------|
| in | <i>table</i>       | The remap table reference [R01178].                                              |
| in | <i>dst↔<br/>_x</i> | The destination x coordinate [R01179].                                           |
| in | <i>dst↔<br/>_y</i> | The destination y coordinate [R01180].                                           |
| in | <i>src↔<br/>_x</i> | The source x coordinate in float representation to allow interpolation [R01181]. |
| in | <i>src↔<br/>_y</i> | The source y coordinate in float representation to allow interpolation [R01182]. |

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01183]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | table is not a valid <code>vx_remap</code> reference.  |

**vxGetRemapPoint()**

```
vx_status VX_API_CALL vxGetRemapPoint (
 vx_remap table,
 vx_uint32 dst_x,
 vx_uint32 dst_y,
 vx_float32 * src_x,
 vx_float32 * src_y)
```

Retrieves the source pixel point from a destination pixel [R01184].

## Parameters

|     |                    |                                                                                                                       |
|-----|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| in  | <code>table</code> | The remap table reference [R01185].                                                                                   |
| in  | <code>dst_x</code> | The destination x coordinate [R01186].                                                                                |
| in  | <code>dst_y</code> | The destination y coordinate [R01187].                                                                                |
| out | <code>src_x</code> | The pointer to the location to store the source x coordinate in float representation to allow interpolation [R01188]. |
| out | <code>src_y</code> | The pointer to the location to store the source y coordinate in float representation to allow interpolation [R01189]. |

## Returns

A The `vx_status Constants` value.

## Return values

|                                         |                                                        |
|-----------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01190]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | table is not a valid <code>vx_remap</code> reference.  |

**vxQueryRemap()**

```
vx_status VX_API_CALL vxQueryRemap (
 vx_remap table,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries attributes from a Remap table [R01191].

## Parameters

|    |                    |                              |
|----|--------------------|------------------------------|
| in | <code>table</code> | The remap to query [R01192]. |
|----|--------------------|------------------------------|

**Parameters**

|     |                  |                                                                                             |
|-----|------------------|---------------------------------------------------------------------------------------------|
| in  | <i>attribute</i> | The attribute to query [R01193]. Use a <a href="#">The remap object attributes</a> . value. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01194].                                |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01195].                     |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                          |
|-----------------------------------|----------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01196].   |
| <i>VX_ERROR_INVALID_REFERENCE</i> | table is not a valid <a href="#">vx_remap</a> reference. |

## 3.59 Object: Scalar

### 3.59.1 Detailed Description

Defines the Scalar Object interface.

#### Modules

- [The Scalar Attributes Constants](#)

*The scalar attributes list.*

#### Typedefs

- `typedef struct _vx_scalar * vx_scalar`  
*An opaque reference to a scalar [R01409].*

#### Functions

- `vx_status VX_API_CALL vxCopyScalar (vx_scalar scalar, void *user_ptr, vx_enum usage, vx_enum user_mem_type)`  
*Allows the application to copy from/into a scalar object [R00843].*
- `vx_scalar VX_API_CALL vxCreateScalar (vx_context context, vx_enum data_type, const void *ptr)`  
*Creates a reference to a scalar object [R00828]. Also see [Node Parameters](#).*
- `vx_status VX_API_CALL vxQueryScalar (vx_scalar scalar, vx_enum attribute, void *ptr, vx_size size)`  
*Queries attributes from a scalar [R00837].*
- `vx_status VX_API_CALL vxReleaseScalar (vx_scalar *scalar)`  
*Releases a reference to a scalar object [R00833]. The object may not be garbage collected until its total reference count is zero.*

### 3.59.2 Typedef Documentation

#### `vx_scalar`

```
typedef struct _vx_scalar* vx_scalar
```

An opaque reference to a scalar [R01409].  
A scalar can be up to 64 bits wide [R01410].

See also

[vxCreateScalar](#)

Definition at line 183 of file [vx\\_types.h](#).

### 3.59.3 Function Documentation

#### `vxCreateScalar()`

```
vx_scalar VX_API_CALL vxCreateScalar (
 vx_context context,
 vx_enum data_type,
 const void * ptr)
```

Creates a reference to a scalar object [R00828]. Also see [Node Parameters](#).

**Parameters**

|    |                  |                                                                                                                                   |
|----|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The reference to the system context [R00829].                                                                                     |
| in | <i>data_type</i> | The type of the scalar. Must be greater than <code>VX_TYPE_INVALID</code> and less than <code>VX_TYPE_SCALAR_MAX</code> [R00830]. |
| in | <i>ptr</i>       | The pointer to the initial value of the scalar [R00831].                                                                          |

**Returns**

A scalar reference `vx_scalar` [R00832]. Any possible errors preventing a successful creation should be checked using `vxGetStatus`.

**vxReleaseScalar()**

```
vx_status VX_API_CALL vxReleaseScalar (
 vx_scalar * scalar)
```

Releases a reference to a scalar object [R00833]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |               |                                                |
|----|---------------|------------------------------------------------|
| in | <i>scalar</i> | The pointer to the scalar to release [R00834]. |
|----|---------------|------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R00835].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                         |
|-----------------------------------------|---------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00836].  |
| <code>VX_ERROR_INVALID_REFERENCE</code> | scalar is not a valid <code>vx_scalar</code> reference. |

**vxQueryScalar()**

```
vx_status VX_API_CALL vxQueryScalar (
 vx_scalar scalar,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries attributes from a scalar [R00837].

**Parameters**

|     |                  |                                                                                             |
|-----|------------------|---------------------------------------------------------------------------------------------|
| in  | <i>scalar</i>    | The scalar object [R00838].                                                                 |
| in  | <i>attribute</i> | The attribute to query, use a The <code>Scalar Attributes Constants</code> value. [R00839]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R00840].                                |
| in  | <i>size</i>      | The size of the container to which <i>ptr</i> points [R00841].                              |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00842</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | scalar is not a valid <a href="#">vx_scalar</a> reference.      |

**vxCopyScalar()**

```
vx_status VX_API_CALL vxCopyScalar (
 vx_scalar scalar,
 void * user_ptr,
 vx_enum usage,
 vx_enum user_mem_type)
```

Allows the application to copy from/into a scalar object [*R00843*].

## Parameters

|    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>scalar</i>        | The reference to the scalar object that is the source or the destination of the copy [ <i>R00844</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| in | <i>user_ptr</i>      | The address of the memory location where to store the requested data if the copy was requested in read mode, or from where to get the data to store into the scalar object if the copy was requested in write mode [ <i>R00845</i> ]. In the user memory, the scalar is a variable of the type corresponding to <a href="#">VX_SCALAR_TYPE</a> . The accessible memory must be large enough to contain this variable.                                                                                                                                                 |
| in | <i>usage</i>         | This declares the effect of the copy with regard to the scalar object [ <i>R00846</i> ]. using the <a href="#">The memory accessor hint flags</a> . value. Only <a href="#">VX_READ_ONLY</a> and <a href="#">VX_WRITE_ONLY</a> are supported [ <i>R00847</i> ]: <ul style="list-style-type: none"> <li><a href="#">VX_READ_ONLY</a> means that data are copied from the scalar object into the user memory [<i>R00848</i>].</li> <li><a href="#">VX_WRITE_ONLY</a> means that data are copied into the scalar object from the user memory [<i>R00849</i>].</li> </ul> |
| in | <i>user_mem_type</i> | A <a href="#">Memory import type constants</a> . value that specifies the memory type of the memory referenced by the user_addr [ <i>R00850</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                          |                                                                 |
|------------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [ <i>R00851</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | scalar is not a valid <a href="#">vx_scalar</a> reference.      |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | An other parameter is incorrect.                                |

## 3.60 Object: Threshold

### 3.60.1 Detailed Description

Defines the Threshold Object Interface.

#### Modules

- [The Threshold types.](#)  
*The Threshold types.*
- [The threshold attributes.](#)  
*The threshold attributes.*

#### Typedefs

- typedef struct \_vx\_threshold \* [vx\\_threshold](#)  
*The Threshold Object. A thresholding object contains the types and limit values of the thresholding required.*

#### Functions

- [vx\\_threshold VX\\_API\\_CALL vxCreateThreshold](#) ([vx\\_context](#) c, [vx\\_enum](#) thresh\_type, [vx\\_enum](#) data\_type)  
*Creates a reference to a threshold object of a given type [R01029].*
- [vx\\_status VX\\_API\\_CALL vxQueryThreshold](#) ([vx\\_threshold](#) thresh, [vx\\_enum](#) attribute, void \*ptr, [vx\\_size](#) size)  
*Queries an attribute on the threshold object [R01044].*
- [vx\\_status VX\\_API\\_CALL vxReleaseThreshold](#) ([vx\\_threshold](#) \*thresh)  
*Releases a reference to a threshold object [R01034]. The object may not be garbage collected until its total reference count is zero.*
- [vx\\_status VX\\_API\\_CALL vxSetThresholdAttribute](#) ([vx\\_threshold](#) thresh, [vx\\_enum](#) attribute, const void \*ptr, [vx\\_size](#) size)  
*Sets attributes on the threshold object [R01038].*

### 3.60.2 Function Documentation

#### vxCreateThreshold()

```
vx_threshold VX_API_CALL vxCreateThreshold (
 vx_context c,
 vx_enum thresh_type,
 vx_enum data_type)
```

Creates a reference to a threshold object of a given type [R01029].

#### Parameters

|    |                    |                                                     |
|----|--------------------|-----------------------------------------------------|
| in | <i>c</i>           | The reference to the overall context [R01030].      |
| in | <i>thresh_type</i> | The type of threshold to create [R01031].           |
| in | <i>data_type</i>   | The data type of the threshold's value(s) [R01032]. |

#### Returns

A threshold reference [vx\\_threshold](#) [R01033]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#).

**vxReleaseThreshold()**

```
vx_status VX_API_CALL vxReleaseThreshold (
 vx_threshold * thresh)
```

Releases a reference to a threshold object [R01034]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |               |                                                   |
|----|---------------|---------------------------------------------------|
| in | <i>thresh</i> | The pointer to the threshold to release [R01035]. |
|----|---------------|---------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R01036].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                            |
|-----------------------------------------|------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01037].     |
| <code>VX_ERROR_INVALID_REFERENCE</code> | thresh is not a valid <code>vx_threshold</code> reference. |

**vxSetThresholdAttribute()**

```
vx_status VX_API_CALL vxSetThresholdAttribute (
 vx_threshold thresh,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

Sets attributes on the threshold object [R01038].

**Parameters**

|    |                  |                                                                                       |
|----|------------------|---------------------------------------------------------------------------------------|
| in | <i>thresh</i>    | The threshold object to set [R01039].                                                 |
| in | <i>attribute</i> | The attribute to modify. Use a The <code>threshold attributes.</code> value [R01040]. |
| in | <i>ptr</i>       | The pointer to the value to which to set the attribute [R01041].                      |
| in | <i>size</i>      | The size of the data pointed to by <i>ptr</i> [R01042].                               |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                            |
|-----------------------------------------|------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01043].     |
| <code>VX_ERROR_INVALID_REFERENCE</code> | thresh is not a valid <code>vx_threshold</code> reference. |

**vxQueryThreshold()**

```
vx_status VX_API_CALL vxQueryThreshold (
```

```
vx_threshold thresh,
vx_enum attribute,
void * ptr,
vx_size size)
```

Queries an attribute on the threshold object [R01044].

#### Parameters

|     |                  |                                                                                            |
|-----|------------------|--------------------------------------------------------------------------------------------|
| in  | <i>thresh</i>    | The threshold object to set [R01045].                                                      |
| in  | <i>attribute</i> | The attribute to query. Use a <a href="#">The vx_threshold attributes.</a> value [R01046]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01047].                               |
| in  | <i>size</i>      | The size of the container to which <i>ptr</i> points [R01048].                             |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                   |                                                               |
|-----------------------------------|---------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [R01049].        |
| <i>VX_ERROR_INVALID_REFERENCE</i> | thresh is not a valid <a href="#">vx_threshold</a> reference. |

## 3.61 Object: ObjectArray

### 3.61.1 Detailed Description

An opaque array object that could be an array of any data-object (not data-type) of OpenVX except Delay and ObjectArray objects.

ObjectArray is a strongly-typed container of OpenVX data-objects. ObjectArray refers to the collection of similar data-objects as a single entity that can be created or assigned as inputs/outputs and as a single entity. In addition, a single object from the collection can be accessed individually by getting its reference. The single object remains as part of the ObjectArray through its entire life cycle.

### Modules

- [The ObjectArray object attributes.](#)

*The ObjectArray object attributes.*

### Typedefs

- `typedef struct _vx_object_array * vx_object_array`

*The ObjectArray Object. ObjectArray is a strongly-typed container of OpenVX data-objects.*

### Functions

- `vx_object_array VX_API_CALL vxCreateObjectArray (vx_context context, vx_reference exemplar, vx_size count)`  
*Creates a reference to an ObjectArray of count objects.*
- `vx_object_array VX_API_CALL vxCreateVirtualObjectArray (vx_graph graph, vx_reference exemplar, vx_size count)`  
*Creates an opaque reference to a virtual ObjectArray with no direct user access.*
- `vx_reference VX_API_CALL vxGetObjectArrayItem (vx_object_array arr, vx_uint32 index)`  
*Retrieves the reference to the OpenVX Object in location index of the ObjectArray [R01307].*
- `vx_status VX_API_CALL vxQueryObjectArray (vx_object_array arr, vx_enum attribute, void *ptr, vx_size size)`  
*Queries an attribute from the ObjectArray [R01316].*
- `vx_status VX_API_CALL vxReleaseObjectArray (vx_object_array *arr)`  
*Releases a reference of an ObjectArray object [R01312].*

### 3.61.2 Function Documentation

#### vxCreateObjectArray()

```
vx_object_array VX_API_CALL vxCreateObjectArray (
 vx_context context,
 vx_reference exemplar,
 vx_size count)
```

Creates a reference to an ObjectArray of count objects.

It uses the metadata of the exemplar to determine the object attributes [R01292], ignoring the object data [R01293]. It does not alter the exemplar [R01294] or keep or release the reference to the exemplar [R01295]. For the definition of supported attributes see [vxSetMetaFormatAttribute](#). In case the exemplar is a virtual object it must be of immutable metadata, thus it is not allowed to be dimensionless or formatless [R01296].

#### Parameters

|    |         |                                                |
|----|---------|------------------------------------------------|
| in | context | The reference to the overall Context [R01297]. |
|----|---------|------------------------------------------------|

**Parameters**

|    |                 |                                                                                                   |
|----|-----------------|---------------------------------------------------------------------------------------------------|
| in | <i>exemplar</i> | The exemplar object that defines the metadata of the created objects in the ObjectArray [R01298]. |
| in | <i>count</i>    | Number of Objects to create in the ObjectArray [R01299].                                          |

**Returns**

An ObjectArray reference `vx_object_array` [R01300]. Any possible errors preventing a successful creation should be checked using `vxGetStatus`. Data objects are not initialized by this function.

**vxCreateVirtualObjectArray()**

```
vx_object_array VX_API_CALL vxCreateVirtualObjectArray (
 vx_graph graph,
 vx_reference exemplar,
 vx_size count)
```

Creates an opaque reference to a virtual ObjectArray with no direct user access.

This function creates an ObjectArray of count objects with similar behavior as `vxCreateObjectArray` [R01301]. The only difference is that the objects that are created are virtual in the given graph.

**Parameters**

|    |                 |                                                                                                                                                                                                        |
|----|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>graph</i>    | Reference to the graph where to create the virtual ObjectArray [R01302].                                                                                                                               |
| in | <i>exemplar</i> | The exemplar object that defines the type of object in the ObjectArray [R01303]. Only exemplar type of <code>vx_image</code> , <code>vx_array</code> and <code>vx_pyramid</code> are allowed [R01304]. |
| in | <i>count</i>    | Number of Objects to create in the ObjectArray [R01305].                                                                                                                                               |

**Returns**

A ObjectArray reference `vx_object_array` [R01306]. Any possible errors preventing a successful creation should be checked using `vxGetStatus`.

**vxGetObjectArrayItem()**

```
vx_reference VX_API_CALL vxGetObjectArrayItem (
 vx_object_array arr,
 vx_uint32 index)
```

Retrieves the reference to the OpenVX Object in location index of the ObjectArray [R01307].

This is a `vx_reference`, which can be used elsewhere in OpenVX. A call to `vxRelease<Object>` or `vxReleaseReference` is necessary to release the Object for each call to this function.

**Parameters**

|    |              |                                                      |
|----|--------------|------------------------------------------------------|
| in | <i>arr</i>   | The ObjectArray [R01308].                            |
| in | <i>index</i> | The index of the object in the ObjectArray [R01309]. |

**Returns**

A reference to an OpenVX data object [R01310]. Any possible errors preventing a successful completion of the function should be checked using `vxGetStatus` [R01311].

**vxReleaseObjectArray()**

```
vx_status VX_API_CALL vxReleaseObjectArray (
 vx_object_array * arr)
```

Releases a reference of an ObjectArray object [R01312].

The object may not be garbage collected until its total reference and its contained objects count is zero. After returning from this function the reference is zeroed/cleared [R01313].

**Parameters**

|    |            |                                                     |
|----|------------|-----------------------------------------------------|
| in | <i>arr</i> | The pointer to the ObjectArray to release [R01314]. |
|----|------------|-----------------------------------------------------|

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                                   |
|-----------------------------------------|-------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R01315].            |
| <code>VX_ERROR_INVALID_REFERENCE</code> | <i>arr</i> is not a valid <code>vx_object_array</code> reference. |

**vxQueryObjectArray()**

```
vx_status VX_API_CALL vxQueryObjectArray (
 vx_object_array arr,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries an attribute from the ObjectArray [R01316].

**Parameters**

|     |                  |                                                                                                |
|-----|------------------|------------------------------------------------------------------------------------------------|
| in  | <i>arr</i>       | The reference to the ObjectArray [R01317].                                                     |
| in  | <i>attribute</i> | The attribute to query [R01318]. Use a The <code>ObjectArray object attributes</code> . value. |
| out | <i>ptr</i>       | The location at which to store the resulting value [R01319].                                   |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [R01320].                        |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                                          |
|------------------------------------------|--------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R01321].                   |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | <i>arr</i> is not a valid <code>vx_object_array</code> reference.        |
| <code>VX_ERROR_NOT_SUPPORTED</code>      | If the <i>attribute</i> is not a value supported on this implementation. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If any of the other parameters are incorrect.                            |

## 3.62 Object: Import

### 3.62.1 Detailed Description

Defines the Import Object interface.

An abstract object serving as a container for graphs and data objects imported from memory data in a vendor-specific format. The import object is transparent in that objects appear in the context, but an import may be searched in order to retrieve an object reference by name. The function `vxExportObjectsToMemory` is used to create the information in memory initially, and parameters supplied to this function must match those supplied to `vxImportObjectsFromMemory`, which is used to create an import object.

Data objects and graphs may be exported to memory in a vendor-specific format. Any unverified graphs will be verified during this export operation, although an implementation may choose to set the graph state to unverified after the operation. The data produced by the export operation may be written out to a file or other wise communicated to another compatible implementation where it may be imported using `vxImportObjectsFromMemory`. Graphs exported and subsequently imported in this way may be executed without further verification. Thus the `vxExportObjectsToMemory` function behaves very much like a compile operation producing a binary which may be subsequently loaded and executed.

### Macros

- `#define VX_IX_USE_APPLICATION_CREATE (VX_ENUM_BASE(VX_ID_KHRONOS, VX_ENUM_IX_USE) + 0x0)`  
*How to export and import an object.*
- `#define VX_IX_USE_EXPORT_VALUES (VX_ENUM_BASE(VX_ID_KHRONOS, VX_ENUM_IX_USE) + 0x1)`  
*How to export and import an object.*
- `#define VX_IX_USE_NO_EXPORT_VALUES (VX_ENUM_BASE(VX_ID_KHRONOS, VX_ENUM_IX_USE) + 0x2)`  
*How to export and import an object.*
- `#define VX_TYPE_IMPORT 0x814`  
*The Object Type Enumeration for import.*

### Typedefs

- `typedef struct _vx_import * vx_import`  
*The Import Object. Import is a container of OpenVX objects, which may be retrieved by name.*

### Functions

- `vx_status VX_API_CALL vxExportObjectsToMemory (vx_context context, vx_size numrefs, const vx_reference *refs, const vx_enum *uses, const vx_uint8 **ptr, vx_size *length)`  
*Exports selected objects to memory in a vendor-specific format.*
- `vx_reference VX_API_CALL vxGetImportReferenceByName (vx_import import, const vx_char *name)`  
*Get a reference from the import object by name.*
- `vx_import VX_API_CALL vxImportObjectsFromMemory (vx_context context, vx_size numrefs, vx_reference *refs, const vx_enum *uses, const vx_uint8 *ptr, vx_size length)`  
*Imports objects into a context from a vendor-specific format in memory.*
- `vx_status VX_API_CALL vxReleaseExportedMemory (vx_context context, const vx_uint8 **ptr)`  
*Releases memory allocated for a binary export when it is no longer required.*
- `vx_status VX_API_CALL vxReleaseImport (vx_import *import)`  
*Releases an import object when no longer required.*

### 3.62.2 Macro Definition Documentation

**VX\_IX\_USE\_APPLICATION\_CREATE**

```
#define VX_IX_USE_APPLICATION_CREATE (VX_ENUM_BASE(VX_ID_KHRONOS, VX_ENUM_IX_USE) + 0x0)
```

How to export and import an object.

The application will create the object before import.

Definition at line 45 of file [vx\\_import.h](#).

**3.62.3 Function Documentation****vxImportObjectsFromMemory()**

```
vx_import VX_API_CALL vxImportObjectsFromMemory (
 vx_context context,
 vx_size numrefs,
 vx_reference * refs,
 const vx_enum * uses,
 const vx_uint8 * ptr,
 vx_size length)
```

Imports objects into a context from a vendor-specific format in memory.

This function imports objects from a memory blob previously created using [vxExportObjectsToMemory](#) [R01336].

A pointer to memory is given where a list of references is stored, together with the list of uses which describes how the references are used. The number of references given and the list of uses must match that given upon export, or this function will not be successful [R01337].

The *uses* array specifies how the objects in the corresponding *refs* array will be imported:

- [VX\\_IX\\_USE\\_APPLICATION\\_CREATE](#)

The application must create the object and supply the reference; the meta-data of the object must match exactly the meta-data of the object when it was exported, except that the name need not match [R01338].

If the supplied reference has a different name to that stored, the supplied name is used [R01339].

- [VX\\_IX\\_USE\\_EXPORT\\_VALUES](#)

The implementation will create the object and set the data in it [R01340].

Any data not defined at the time of export of the object will be set to a default value (zero in the absence of any other definition) upon import [R01341].

- `VX_IX_USE_NO_EXPORT_VALUES`

The implementation will create the object and the importing application will set values as applicable [R01342].

References are obtained from the import API for those objects whose references were listed at the time of export. These are not the same objects; they are equivalent objects created by the framework at import time. The implementation guarantees that references will be available and valid for all objects listed at the time of export, or the import will fail [R01343].

The import operation will fail if more than one object whose reference is listed at *refs* has been given the same non-zero length name (via `vxSetReferenceName`) [R01344].

The import will be unsuccessful if any of the parameters supplied is NULL [R01345].

After completion of the function the memory at *ptr* may be deallocated by the application as it will not be used by any of the created objects [R01346].

Any delays imported with graphs for which they are registered for auto-aging remain registered for auto-aging [R01347].

After import, a graph must execute with exactly the same effect with respect to its visible parameters as before export [R01348].

#### Note

The *refs* array must be the correct length to hold all references of the import; this will be the same length that was supplied at the time of export. Only references for objects created by the application, where the corresponding *uses* entry is `VX_IX_USE_APPLICATION_CREATE` should be filled in by the application; all other entries will be supplied by the framework and may be initialised by the application to NULL. The *uses* array must have the identical length and content as given at the time of export, and the value of *numrefs* must also match; these measures increase confidence that the import contains the correct data.

Graph parameters may be changed after import by using the `vxSetGraphParameterByIndex` API, and images may also be changed by using the `vxSwapImageHandle` API. When `vxSetGraphParameterByIndex` is used, the framework will check that the new parameter is of the correct type to run with the graph, which cannot be re-verified. If the reference supplied is not suitable, an error will be returned, but there may be circumstances where changing graph parameters for unsuitable ones is not detected and could lead to implementation-dependent behaviour; one such circumstance is when the new parameters are images corresponding to overlapping regions of interest. The user should avoid these circumstances.

In other words,

- The meta data of the new graph parameter must match the meta data of the graph parameter it replaces [R01349].
- A graph parameter must not be NULL [R01350].

#### Parameters

|         |                |                                                                                                   |
|---------|----------------|---------------------------------------------------------------------------------------------------|
| in      | <i>context</i> | context into which to import objects, must be valid [R01351].                                     |
| in      | <i>numrefs</i> | number of references to import, must match export [R01352].                                       |
| in, out | <i>refs</i>    | references imported or application-created data which must match meta-data of the export [R01353] |
| in      | <i>uses</i>    | how to import the references, must match export values [R01354]                                   |
| in      | <i>ptr</i>     | pointer to binary buffer containing a valid binary export [R01355]                                |
| in      | <i>length</i>  | number of bytes at *ptr, i.e. the length of the export [R01356]                                   |

#### Returns

A `vx_import` [R01357]. Calling `vxGetStatus` with the `vx_import` as a parameter will return `VX_SUCCESS` if the function was successful [R01358].

Another value is given to indicate that there was an error [R01359].

An implementation may provide several different error codes to give useful diagnostic information in the event of failure to import objects, but these are not required to indicate possibly recovery mechanisms, and for safety critical use assume errors are not recoverable.

## Postcondition

`vxReleaseImport` is used to release the import object.

Use `vxReleaseReference` or an appropriate specific release function to release the references in the array refs when they are no longer required.

**vxReleaseImport()**

```
vx_status VX_API_CALL vxReleaseImport (
 vx_import * import)
```

Releases an import object when no longer required.

This function releases the reference to the import object [R01360].

Other objects including those imported at the time of creation of the import object are unaffected [R01361].

## Parameters

|                      |                     |                                                             |
|----------------------|---------------------|-------------------------------------------------------------|
| <code>in, out</code> | <code>import</code> | The pointer to the reference to the import object [R01362]. |
|----------------------|---------------------|-------------------------------------------------------------|

## Postcondition

After returning successfully from this function the reference is zeroed [R01363].

## Returns

A `vx_status` value.

## Return values

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code> | <p>If no errors occurred and the import was successfully released [R01364].</p> <p>An error is indicated when the return value is not <code>VX_SUCCESS</code> [R01365].</p> <p>An implementation may provide several different return values to give useful diagnostic information in the event of failure to export, but these are not required to indicate possibly recovery mechanisms, and for safety critical use assume errors are not recoverable.</p> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Precondition

`vxImportObjectsFromMemory` is used to create an import object.

**vxGetImportReferenceByName()**

```
vx_reference VX_API_CALL vxGetImportReferenceByName (
 vx_import import,
 const vx_char * name)
```

Get a reference from the import object by name.

All accessible references of the import object created using `vxImportObjectsFromMemory` are in the array `refs`, which is populated partly by the application before import, and partly by the framework. However, it may be more convenient to access the references in the import object without referring to this array, for example if the import object is passed as a parameter to another function. In this case, references may be retrieved by name, assuming that `vxSetReferenceName` was called to assign a name to the reference. This function searches the given import for the given name and returns the associated reference [R01366].

The reference may have been named either before export or after import [R01367].

If more than one reference exists in the import with the given name, this is an error [R01368].

Only references in the array `refs` after calling `vxImportObjectsFromMemory` may be retrieved using this function [R01369].

A reference to a named object may be obtained from a valid import object using this API even if all other references to the object have been released [R01370].

#### Parameters

|    |               |                                                                                                                                                                               |
|----|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>import</i> | The import object in which to find the name; the function will fail if this parameter is not valid [R01371].                                                                  |
| in | <i>name</i>   | The name to find, points to a string of at least one and less than VX_MAX_REFERENCE_NAME bytes followed by a zero byte; the function will fail if this is not valid [R01372]. |

#### Returns

A `vx_reference` [R01373].

Calling `vxGetStatus` with the reference as a parameter will return VX\_SUCCESS if the function was successful [R01374].

Another value is given to indicate that there was an error [R01375].

On success, the reference count of the object in question is incremented [R01376].

An implementation may provide several different error codes to give useful diagnostic information in the event of failure to retrieve a reference, but these are not required to indicate possibly recovery mechanisms, and for safety critical use assume errors are not recoverable.

#### Precondition

`vxSetReferenceName` was used to name the reference.

#### Postcondition

use `ref vxReleaseReference` or appropriate specific release function to release a reference obtained by this method.

### **vxExportObjectsToMemory()**

```
vx_status VX_API_CALL vxExportObjectsToMemory (
 vx_context context,
 vx_size numrefs,
 const vx_reference * refs,
 const vx_enum * uses,
 const vx_uint8 ** ptr,
 vx_size * length)
```

Exports selected objects to memory in a vendor-specific format.

A list of references in the given context is supplied to this function, and all information required to re-create these is stored in memory in such a way that those objects may be re-created with the corresponding import function, according to the usage specified by the *uses* parameter [R01377].

The information must be context independent in that it may be written to external storage for later retrieval with another instantiation of a compatible implementation [R01378].

The list of objects to export may contain only valid references (i.e. `vxGetStatus()` will return VX\_SUCCESS) to `vx_graph` and non-virtual data objects or the function will fail [R01379]. (Specifically not `vx_context`, `vx_import`, `vx_node`, `vx_kernel`, `vx_parameter` or `vx_meta_format`)

Some node creation functions take C parameters rather than OpenVX data objects (such as the *gradient\_size* parameter of `vxHarrisCornersNode` that is provided as a `vx_int32`), because these are intended to be fixed at node creation time; nevertheless OpenVX data objects may be assigned to them, for example if the `vxCreateGenericNode` API is used. A data object corresponding to a node parameter that is intended to be fixed at node creation time must not be in the list of exported objects nor attached as a graph parameter or the export operation will fail [R01380].

The *uses* array specifies how the objects in the corresponding *refs* array will be exported. A data object will always have its meta-data (e.g. dimensions and format of an image) exported, and optionally may have its data (e.g. pixel values) exported, and additionally you can decide whether the importing application will create data objects to replace those attached to graphs, or if the implementation will automatically create them:

- [VX\\_IX\\_USE\\_APPLICATION\\_CREATE](#)

Export sufficient data to check that an application-supplied object is compatible when the data is later imported [R01381].

Note

This value must be given for images created from handles, or the the export operation will fail [R01382]

- [VX\\_IX\\_USE\\_EXPORT\\_VALUES](#)

Export complete information (for example image data or value of a scalar) [R01383].

- [VX\\_IX\\_USE\\_NO\\_EXPORT\\_VALUES](#)

Export meta-data only; the importing application will set values as applicable [R01384]

The values in *uses* are applicable only for data objects and are ignored for *vx\_graph* objects [R01385].  
If the list *refs* contains *vx\_graph* objects, these graphs will be verified during the export operation and the export operation will fail if verification fails; when successfully exported graphs are subsequently imported they will appear as verified [R01386].

Note

The implementation may also choose to re-verify any previously verified graphs and apply optimisations based upon which references are to be exported and how.

Any data objects attached to a graph that are hidden, i.e. their references are not in the list *refs*, may be treated by the implementation as virtual objects, since they can never be visible when the graph is subsequently imported.

Note that imported graphs cannot become unverified. Attempts to change the graph that might normally cause the graph to be unverified, e.g. calling *vxSetGraphParameterByIndex* with an object with different metadata, will fail.

The implementation should make sure that all permissible changes of exported objects are possible without re-verification. For example:

- A uniform image may be swapped for a non-uniform image, so corresponding optimisations should be inhibited if a uniform image appears in the *refs* list
- An image that is a region of interest of another image may be similarly replaced by any other image of matching size and format, and vice-versa

If a graph is exported that has delays registered for auto-aging, then this information is also exported [R01387].

If the function is called with NULL for any of its parameters, this is an error [R01388].

The reference counts of objects as visible to the calling application will not be affected by calling this function [R01389].

The export operation will fail if more than one object whose reference is listed at *refs* has been given the same non-zero length name (via [vxSetReferenceName](#)) [R01390].

If a graph listed for export has any graph parameters not listed at *refs*, then the export operation will fail [R01391].

Note

The order of the references supplied in the *refs* array will be the order in which the framework will supply references for the corresponding import operation with [vxImportObjectsFromMemory](#).

The same length of *uses* array, containing the same values, and the same value of *numrefs*, must be supplied for the corresponding import operation.

For objects not listed in *refs*, the following rules apply:

1. In any one graph, if an object is not connected as an output of a node in a graph being exported then its data values will be exported (for subsequent import) [R01392].
2. Where the object in (1) is a composite object (such as a pyramid) then rule (1) applies to all of its sub-objects [R01393].
3. Where the object in (1) is a sub-object such as a region of interest, and the composite object (in this case the parent image) does not meet the conditions of rule (1), then rule (1) applies to the sub-object only [R01394].

**Parameters**

|     |                |                                                                                                                 |
|-----|----------------|-----------------------------------------------------------------------------------------------------------------|
| in  | <i>context</i> | context from which to export objects, must be valid [R01395].                                                   |
| in  | <i>numrefs</i> | number of references to export [R01396].                                                                        |
| in  | <i>refs</i>    | references to export. This is an array of length numrefs populated with the references to export [R01397].      |
| in  | <i>uses</i>    | how to export the references. This is an array of length numrefs containing values as described above [R01398]. |
| out | <i>ptr</i>     | returns pointer to binary buffer. On error this is set to NULL [R01399].                                        |
| out | <i>length</i>  | number of bytes at *ptr. On error this is set to zero [R01400].                                                 |

**Returns**

A `vx_status` value.

**Return values**

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code> | <p>If no errors occurred and the objects were successfully exported [R01401]. An error is indicated when the return value is not <code>VX_SUCCESS</code>.</p> <p>An implementation may provide several different return values to give useful diagnostic information in the event of failure to export, but these are not required to indicate possible recovery mechanisms, and for safety critical use assume errors are not recoverable.</p> |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Postcondition**

`vxReleaseExportedMemory` is used to deallocate the memory.

**`vxReleaseExportedMemory()`**

```
vx_status VX_API_CALL vxReleaseExportedMemory (
 vx_context context,
 const vx_uint8 ** ptr)
```

Releases memory allocated for a binary export when it is no longer required.

This function releases memory allocated by `vxExportObjectsToMemory` [R01402].

**Parameters**

|         |                |                                                                                                                                                                                                                                |
|---------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in      | <i>context</i> | The context for which <code>vxExportObjectsToMemory</code> was called [R01403].                                                                                                                                                |
| in, out | <i>ptr</i>     | A pointer previously set by calling <code>vxExportObjectsToMemory</code> [R01404]. The function will fail if *ptr does not contain an address of memory previously allocated by <code>vxExportObjectsToMemory</code> [R01405]. |

**Postcondition**

After returning from successfully from this function \*ptr is set to NULL [R01406].

**Returns**

A `vx_status` value.

## Return values

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code> | <p>If no errors occurred and the memory was successfully released [R01407].</p> <p>An error is indicated when the return value is not <code>VX_SUCCESS</code> [R01408].</p> <p>An implementation may provide several different return values to give useful diagnostic information in the event of failure to export, but these are not required to indicate possible recovery mechanisms, and for safety critical use assume errors are not recoverable.</p> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Precondition

`vxExportObjectsToMemory` is used to allocate the memory.

## 3.63 Administrative Features

### 3.63.1 Detailed Description

Defines the Administrative Features of OpenVX.

These features are administrative in nature and require more understanding and are more complex to use.

Defines the advanced features of the Array Interface.

#### Functions

- `vx_enum VX_API_CALL vxRegisterUserStruct (vx_context context, vx_size size)`  
*Registers user-defined structures to the context.*

### 3.65.2 Function Documentation

#### `vxRegisterUserStruct()`

```
vx_enum VX_API_CALL vxRegisterUserStruct (
 vx_context context,
 vx_size size)
```

Registers user-defined structures to the context.

#### Parameters

|    |                |                                                       |
|----|----------------|-------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00477]. |
| in | <i>size</i>    | The size of user struct in bytes [R00478].            |

#### Returns

A `vx_enum` value that is a type given to the User to refer to their custom structure when declaring a `vx_↵array` of that structure.

#### Return values

|                              |                                                        |
|------------------------------|--------------------------------------------------------|
| <code>VX_TYPE_INVALID</code> | If the namespace of types has been exhausted [R00479]. |
|------------------------------|--------------------------------------------------------|

#### Note

This call should only be used once within the lifetime of a context for a specific structure.

## 3.66 Object: Node (Advanced)

### 3.66.1 Detailed Description

Defines the advanced features of the Node Interface.

#### Modules

- [Node: Border Modes](#)

*Defines the border mode behaviors.*

#### Functions

- [vx\\_node VX\\_API\\_CALL vxCreateGenericNode](#) ([vx\\_graph](#) graph, [vx\\_kernel](#) kernel)

*Creates a reference to a node object for a given kernel.*

### 3.66.2 Function Documentation

#### **vxCreateGenericNode()**

```
vx_node VX_API_CALL vxCreateGenericNode (
 vx_graph graph,
 vx_kernel kernel)
```

Creates a reference to a node object for a given kernel.

This node has no references assigned as parameters after completion. The client is then required to set these parameters manually by [vxSetParameterByIndex](#). When clients supply their own node creation functions (for use with User Kernels), this is the API to use along with the parameter setting API.

#### Parameters

|    |               |                                                                         |
|----|---------------|-------------------------------------------------------------------------|
| in | <i>graph</i>  | The reference to the graph in which this node exists [ <i>R00760</i> ]. |
| in | <i>kernel</i> | The kernel reference to associate with this new node [ <i>R00761</i> ]. |

#### Returns

A node reference [vx\\_node](#) [*R00762*]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [*R00763*].

#### Note

A call to this API sets all parameters to NULL [*R00764*].

#### Postcondition

Call [vxSetParameterByIndex](#) for as many parameters as needed to be set.

## 3.67 Node: Border Modes

### 3.67.1 Detailed Description

Defines the border mode behaviors.

Border Mode behavior is set as an attribute of the node, not as a direct parameter to the kernel. This allows clients to *set-and-forget* the modes of any particular node that supports border modes. All nodes shall support `VX_BORDER_UNDEFINED` [R00126].

### Modules

- [The border mode list.](#)
- [The unsupported border mode policy list.](#)

### Data Structures

- struct `vx_border_t`

*Use with the enumeration `VX_NODE_BORDER` to set the border mode behavior of a node that supports borders.*  
*[More...](#)*

### 3.67.2 Data Structure Documentation

#### struct `vx_border_t`

Use with the enumeration `VX_NODE_BORDER` to set the border mode behavior of a node that supports borders.

If the indicated border mode is not supported, an error `VX_ERROR_NOT_SUPPORTED` will be reported either at the time the `VX_NODE_BORDER` is set or at the time of graph verification.

Definition at line 1722 of file `vx_types.h`.

#### Data Fields

|                               |                |                                                                                                      |
|-------------------------------|----------------|------------------------------------------------------------------------------------------------------|
| <code>vx_enum</code>          | mode           | See <a href="#">The border mode list..</a>                                                           |
| <code>vx_pixel_value_t</code> | constant_value | For the mode <code>VX_BORDER_CONSTANT</code> , this union contains the value of out-of-bound pixels. |

## 3.68 Object: Delay

### 3.68.1 Detailed Description

Defines the Delay Object interface.

A Delay is an opaque object that contains a manually-controlled, temporally-delayed list of objects. A Delay cannot be an output of a kernel. Also, aging of a Delay (see [vxAgeDelay](#)) cannot be performed during graph execution. Supported delay object types include:

- [VX\\_TYPE\\_ARRAY](#),
- [VX\\_TYPE\\_IMAGE](#),
- [VX\\_TYPE\\_PYRAMID](#),
- [VX\\_TYPE\\_MATRIX](#),
- [VX\\_TYPE\\_CONVOLUTION](#),
- [VX\\_TYPE\\_DISTRIBUTION](#),
- [VX\\_TYPE\\_REMAP](#),
- [VX\\_TYPE\\_LUT](#),
- [VX\\_TYPE\\_THRESHOLD](#),
- [VX\\_TYPE\\_SCALAR](#)

### Modules

- [Delay Attribute Constants](#)

*The delay attribute list.*

### Typedefs

- `typedef struct _vx_delay * vx\_delay`

*The delay object. This is like a ring buffer of objects that is maintained by the OpenVX implementation.*

### Functions

- `vx\_status VX\_API\_CALL vxAgeDelay (vx\_delay delay)`  
*Shifts the internal delay ring by one.*
- `vx\_delay VX\_API\_CALL vxCreateDelay (vx\_context context, vx\_reference exemplar, vx\_size num_slots)`  
*Creates a Delay object [R00882].*
- `vx\_reference VX\_API\_CALL vxGetReferenceFromDelay (vx\_delay delay, vx\_int32 index)`  
*Retrieves a reference to a delay slot object [R00903].*
- `vx\_status VX\_API\_CALL vxQueryDelay (vx\_delay delay, vx\_enum attribute, void *ptr, vx\_size size)`  
*Queries a [vx\\_delay](#) object attribute [R00872].*
- `vx\_status VX\_API\_CALL vxReleaseDelay (vx\_delay *delay)`  
*Releases a reference to a delay object [R00878]. The object may not be garbage collected until its total reference count is zero.*

### 3.68.2 Typedef Documentation

**vx\_delay**

```
typedef struct _vx_delay* vx_delay
```

The delay object. This is like a ring buffer of objects that is maintained by the OpenVX implementation.

See also

[vxCreateDelay](#)

Definition at line [234](#) of file [vx\\_types.h](#).

**3.68.3 Function Documentation****vxQueryDelay()**

```
vx_status VX_API_CALL vxQueryDelay (
 vx_delay delay,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Queries a [vx\\_delay](#) object attribute [*R00872*].

**Parameters**

|     |                  |                                                                                                  |
|-----|------------------|--------------------------------------------------------------------------------------------------|
| in  | <i>delay</i>     | The reference to a delay object [ <i>R00873</i> ].                                               |
| in  | <i>attribute</i> | The attribute to query, use a <a href="#">Delay Attribute Constants</a> value [ <i>R00874</i> ]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [ <i>R00875</i> ].                            |
| in  | <i>size</i>      | The size of the container to which <i>ptr</i> points [ <i>R00876</i> ].                          |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                                 |
|-----------------------------------|-----------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [ <i>R00877</i> ]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | delay is not a valid <a href="#">vx_delay</a> reference.        |

**vxReleaseDelay()**

```
vx_status VX_API_CALL vxReleaseDelay (
 vx_delay * delay)
```

Releases a reference to a delay object [*R00878*]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |              |                                                                         |
|----|--------------|-------------------------------------------------------------------------|
| in | <i>delay</i> | The pointer to the delay object reference to release [ <i>R00879</i> ]. |
|----|--------------|-------------------------------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [*R00880*].

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00881</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | delay is not a valid <a href="#">vx_delay</a> reference.        |

**vxCreateDelay()**

```
vx_delay VX_API_CALL vxCreateDelay (
 vx_context context,
 vx_reference exemplar,
 vx_size num_slots)
```

Creates a Delay object [*R00882*].

This function creates a delay object with `num_slots` slots [*R00883*]. Each slot contains a clone of the exemplar [*R00884*]. The clones only inherit the metadata of the exemplar [*R00885*]. The data content of the exemplar is ignored and the clones have their data is implementation-dependent at delay creation time. The function does not alter the exemplar [*R00886*]. Also, it doesn't retain or release the reference to the exemplar [*R00887*].

## Note

For the definition of metadata attributes see [vxSetMetaFormatAttribute](#).

## Parameters

|    |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The reference to the context [ <i>R00888</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| in | <i>exemplar</i>  | The exemplar object. Supported exemplar object types are: <ul style="list-style-type: none"> <li>• <a href="#">VX_TYPE_ARRAY</a> [<i>R00889</i>]</li> <li>• <a href="#">VX_TYPE_CONVOLUTION</a> [<i>R00890</i>]</li> <li>• <a href="#">VX_TYPE_DISTRIBUTION</a> [<i>R00891</i>]</li> <li>• <a href="#">VX_TYPE_IMAGE</a> [<i>R00892</i>]</li> <li>• <a href="#">VX_TYPE_LUT</a> [<i>R00893</i>]</li> <li>• <a href="#">VX_TYPE_MATRIX</a> [<i>R00894</i>]</li> <li>• <a href="#">VX_TYPE_OBJECT_ARRAY</a> [<i>R00895</i>]</li> <li>• <a href="#">VX_TYPE_PYRAMID</a> [<i>R00896</i>]</li> <li>• <a href="#">VX_TYPE_REMAP</a> [<i>R00897</i>]</li> <li>• <a href="#">VX_TYPE_SCALAR</a> [<i>R00898</i>]</li> <li>• <a href="#">VX_TYPE_THRESHOLD</a> [<i>R00899</i>]</li> </ul> |
| in | <i>num_slots</i> | The number of objects in the delay [ <i>R00900</i> ].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Returns

A delay reference [vx\\_delay](#) [*R00901*]. Any possible errors preventing a successful creation should be checked using [vxGetStatus](#) [*R00902*].

**vxGetReferenceFromDelay()**

```
vx_reference VX_API_CALL vxGetReferenceFromDelay (
 vx_delay delay,
 vx_int32 index)
```

Retrieves a reference to a delay slot object [R00903].

**Parameters**

|    |              |                                                                                  |
|----|--------------|----------------------------------------------------------------------------------|
| in | <i>delay</i> | The reference to the delay object [R00904].                                      |
| in | <i>index</i> | The index of the delay slot from which to extract the object reference [R00905]. |

**Returns**

*vx\_reference*. Any possible errors preventing a successful completion of the function should be checked using *vxGetStatus* [R00906].

**Note**

The delay index is in the range  $[-count + 1, 0]$  [R00907]. 0 is always the *current* object.

A reference retrieved with this function must not be given to its associated release API (e.g. *vxReleaseImage*) unless *vxRetainReference* is used.

**vxAgeDelay()**

```
vx_status VX_API_CALL vxAgeDelay (
 vx_delay delay)
```

Shifts the internal delay ring by one.

This function performs a shift of the internal delay ring by one. This means that, the data originally at index 0 move to index -1 and so forth until index  $-count + 1$  [R00908]. The data originally at index  $-count + 1$  move to index 0 [R00909]. Here *count* is the number of slots in delay ring. When a delay is aged, any graph making use of this delay (delay object itself or data objects in delay slots) gets its data automatically updated accordingly [R00910].

**Parameters**

|    |              |          |
|----|--------------|----------|
| in | <i>delay</i> | [R00911] |
|----|--------------|----------|

**Returns**

A The *vx\_status Constants* value.

**Return values**

|                                   |                                                             |
|-----------------------------------|-------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | Delay was aged; any other value indicates failure [R00912]. |
| <i>VX_ERROR_INVALID_REFERENCE</i> | delay is not a valid <i>vx_delay</i> reference.             |

## 3.69 Object: Kernel

### 3.69.1 Detailed Description

Defines the Kernel Object and Interface.

A Kernel in OpenVX is the abstract representation of an computer vision function, such as a “Sobel Gradient” or “Lucas Kanade Feature Tracking”. A vision function may implement many similar or identical features from other functions, but it is still considered a single unique kernel as long as it is named by the same string and enumeration and conforms to the results specified by OpenVX. Kernels are similar to function signatures in this regard.

In each of the cases, a client of OpenVX could request the kernels in nearly the same manner. There are two main approaches, which depend on the method a client calls to get the kernel reference. The first uses enumerations.

```
vx_kernel kernel = vxGetKernelByEnum(context,
VX_KERNEL_SOBEL_3x3);
vx_node node = vxCreateGenericNode(graph, kernel);
```

The second method depends on using strings to get the kernel reference.

```
vx_kernel kernel = vxGetKernelByName(context, "
org.khronos.openvx.sobel_3x3");
vx_node node = vxCreateGenericNode(graph, kernel);
```

## Modules

### 3.69.3 Typedef Documentation

#### vx\_kernel

```
typedef struct _vx_kernel* vx_kernel
```

An opaque reference to the descriptor of a kernel.

See also

[vxGetKernelByName](#)  
[vxGetKernelByEnum](#)

Definition at line 198 of file [vx\\_types.h](#).

### 3.69.4 Function Documentation

#### vxGetKernelByName()

```
vx_kernel VX_API_CALL vxGetKernelByName (
 vx_context context,
 const vx_char * name)
```

Obtains a reference to a kernel using a string to specify the name [*R00650*].

User Kernels follow a "dotted" heirarchical syntax. For example: "com.company.example.xyz". The following are strings specifying the kernel names:

```
org.khronos.openvx.color_convert
org.khronos.openvx.channel_extract
org.khronos.openvx.channel_combine
org.khronos.openvx.sobel_3x3
org.khronos.openvx.magnitude
org.khronos.openvx.phase
org.khronos.openvx.scale_image
org.khronos.openvx.table_lookup
```

```

org.khronos.openvx.histogram
org.khronos.openvx.equalize_histogram
org.khronos.openvx.absdiff
org.khronos.openvx.mean_stddev
org.khronos.openvx.threshold
org.khronos.openvx.integral_image
org.khronos.openvx.dilate_3x3
org.khronos.openvx.erode_3x3
org.khronos.openvx.median_3x3
org.khronos.openvx.box_3x3
org.khronos.openvx.gaussian_3x3
org.khronos.openvx.custom_convolution
org.khronos.openvx.gaussian_pyramid
org.khronos.openvx.accumulate
org.khronos.openvx.accumulate_weighted
org.khronos.openvx.accumulate_square
org.khronos.openvx.minmaxloc
org.khronos.openvx.convertdepth
org.khronos.openvx.canny_edge_detector
org.khronos.openvx.and
org.khronos.openvx.or
org.khronos.openvx.xor
org.khronos.openvx.not
org.khronos.openvx.multiply
org.khronos.openvx.add
org.khronos.openvx.subtract
org.khronos.openvx.warp_affine
org.khronos.openvx.warp_perspective
org.khronos.openvx.harris_corners
org.khronos.openvx.fast_corners
org.khronos.openvx.optical_flow_pyr_lk
org.khronos.openvx.remap
org.khronos.openvx.halfscale_gaussian
org.khronos.openvx.laplacian_pyramid
org.khronos.openvx.laplacian_reconstruct
org.khronos.openvx.non_linear_filter

```

#### Parameters

|    |                |                                                       |
|----|----------------|-------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00651]. |
| in | <i>name</i>    | The string of the name of the kernel to get [R00652]. |

#### Returns

A kernel reference [R00653]. Any possible errors preventing a successful completion of the function should be checked using `vxGetStatus` [R00654].

#### Precondition

`vxLoadKernels` if the kernel is not provided by the OpenVX implementation.

#### Note

User Kernels should follow a "dotted" hierarchical syntax [R00655]. For example: "com.company.example.↵xyz".

**vxGetKernelByEnum()**

```
vx_kernel VX_API_CALL vxGetKernelByEnum (
 vx_context context,
 vx_enum kernel)
```

Obtains a reference to the kernel [R00656].

Enum values above the standard set are assumed to apply to loaded libraries.

**Parameters**

|    |                |                                                                                                          |
|----|----------------|----------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the implementation context [R00657].                                                    |
| in | <i>kernel</i>  | A value from <a href="#">The list of available kernels</a> or a vendor or client-defined value [R00658]. |

**Returns**

A [vx\\_kernel](#) reference [R00659]. Any possible errors preventing a successful completion of the function should be checked using [vxGetStatus](#) [R00660].

**Precondition**

[vxLoadKernels](#) if the kernel is not provided by the OpenVX implementation.

**vxQueryKernel()**

```
vx_status VX_API_CALL vxQueryKernel (
 vx_kernel kernel,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

This allows the client to query the kernel to get information about the number of parameters, enum values, etc [R00661].

**Parameters**

|     |                  |                                                                                        |
|-----|------------------|----------------------------------------------------------------------------------------|
| in  | <i>kernel</i>    | The kernel reference to query [R00662].                                                |
| in  | <i>attribute</i> | The attribute to query. Use a <a href="#">The Kernel Attribute Constants</a> [R00663]. |
| out | <i>ptr</i>       | The pointer to the location at which to store the resulting value [R00664].            |
| in  | <i>size</i>      | The size of the container to which <i>ptr</i> points [R00665].                         |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                             |                                                                 |
|---------------------------------------------|-----------------------------------------------------------------|
| <a href="#">VX_SUCCESS</a>                  | No errors; any other value indicates failure [R00666].          |
| <a href="#">VX_ERROR_INVALID_REFERENCE</a>  | kernel is not a valid <a href="#">vx_kernel</a> reference.      |
| <a href="#">VX_ERROR_INVALID_PARAMETERS</a> | If any of the other parameters are incorrect.                   |
| <a href="#">VX_ERROR_NOT_SUPPORTED</a>      | If the attribute value is not supported in this implementation. |

**vxReleaseKernel()**

```
vx_status VX_API_CALL vxReleaseKernel (
 vx_kernel * kernel)
```

Release the reference to the kernel [R00667]. The object may not be garbage collected until its total reference count is zero.

**Parameters**

|    |               |                                                          |
|----|---------------|----------------------------------------------------------|
| in | <i>kernel</i> | The pointer to the kernel reference to release [R00668]. |
|----|---------------|----------------------------------------------------------|

**Postcondition**

After returning from this function the reference is zeroed [R00669].

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                         |
|-----------------------------------------|---------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00670].  |
| <code>VX_ERROR_INVALID_REFERENCE</code> | kernel is not a valid <code>vx_kernel</code> reference. |

## 3.70 Object: Parameter

### 3.70.1 Detailed Description

Defines the Parameter Object interface.

An abstract input, output, or bidirectional data object passed to a computer vision function. This object contains the signature of that parameter's usage from the kernel description. This information includes:

- *Signature Index* - The numbered index of the parameter in the signature.
- *Object Type* - e.g., `VX_TYPE_IMAGE` or `VX_TYPE_ARRAY` or some other object type from [The VX\\_Type Constants](#).
- *Usage Model* - e.g., `VX_INPUT`, `VX_OUTPUT`, or `VX_BIDIRECTIONAL`.
- *Presence State* - e.g., `VX_PARAMETER_STATE_REQUIRED` or `VX_PARAMETER_STATE_OPTIONAL`.

### Modules

- [Parameter direction enumeration](#)  
*An indication of how a kernel will treat the given parameter.*
- [The Parameter Attributes Constants](#)  
*The parameter attributes list.*
- [The parameter state type constants.](#)

### Typedefs

- typedef struct \_vx\_parameter \* [vx\\_parameter](#)  
*An opaque reference to a single parameter.*

### Functions

- [vx\\_parameter VX\\_API\\_CALL vxGetKernelParameterByIndex](#) ([vx\\_kernel](#) kernel, [vx\\_uint32](#) index)

### 3.70.2 Typedef Documentation

#### [vx\\_parameter](#)

```
typedef struct _vx_parameter* vx_parameter
```

An opaque reference to a single parameter.

See also

[vxGetParameterByIndex](#)

Definition at line 205 of file [vx\\_types.h](#).

### 3.70.3 Function Documentation

#### vxGetKernelParameterByIndex()

```
vx_parameter VX_API_CALL vxGetKernelParameterByIndex (
 vx_kernel kernel,
 vx_uint32 index)
```

Retrieves a `vx_parameter` from a `vx_kernel` [R00703].

##### Parameters

|    |               |                                       |
|----|---------------|---------------------------------------|
| in | <i>kernel</i> | The reference to the kernel [R00704]. |
| in | <i>index</i>  | The index of the parameter [R00705].  |

##### Returns

A `vx_parameter` reference [R00706]. Any possible errors preventing a successful completion of the function should be checked using `vxGetStatus` [R00707].

#### vxGetParameterByIndex()

```
vx_parameter VX_API_CALL vxGetParameterByIndex (
 vx_node node,
 vx_uint32 index)
```

Retrieves a `vx_parameter` from a `vx_node` [R00805].

##### Parameters

|    |              |                                                                  |
|----|--------------|------------------------------------------------------------------|
| in | <i>node</i>  | The node from which to extract the parameter [R00806].           |
| in | <i>index</i> | The index of the parameter to which to get a reference [R00807]. |

##### Returns

A parameter reference `vx_parameter` [R00808]. Any possible errors preventing a successful completion of the function should be checked using `vxGetStatus` [R00809].

#### vxReleaseParameter()

```
vx_status VX_API_CALL vxReleaseParameter (
 vx_parameter * param)
```

Releases a reference to a parameter object [R00810]. The object may not be garbage collected until its total reference count is zero.

##### Parameters

|    |              |                                                   |
|----|--------------|---------------------------------------------------|
| in | <i>param</i> | The pointer to the parameter to release [R00811]. |
|----|--------------|---------------------------------------------------|

##### Postcondition

After returning from this function the reference is zeroed.

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00812</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | param is not a valid <a href="#">vx_parameter</a> reference.    |

**vxSetParameterByIndex()**

```
vx_status VX_API_CALL vxSetParameterByIndex (
 vx_node node,
 vx_uint32 index,
 vx_reference value)
```

Sets the specified parameter data for a kernel on the node [*R00813*].

## Parameters

|    |              |                                                       |
|----|--------------|-------------------------------------------------------|
| in | <i>node</i>  | The node that contains the kernel [ <i>R00814</i> ].  |
| in | <i>index</i> | The index of the parameter desired [ <i>R00815</i> ]. |
| in | <i>value</i> | The desired value of the parameter [ <i>R00816</i> ]. |

## Note

A user may not provide a NULL value for a mandatory parameter of this API.

## Returns

A [The vx\\_status Constants](#) value.

## Return values

|                                         |                                                                                                                        |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [ <i>R00817</i> ].                                                        |
| <code>VX_ERROR_INVALID_REFERENCE</code> | node is not a valid <a href="#">vx_node</a> reference, or value is not a valid <a href="#">vx_reference</a> reference. |

## See also

[vxSetParameterByReference](#)

**vxSetParameterByReference()**

```
vx_status VX_API_CALL vxSetParameterByReference (
 vx_parameter parameter,
 vx_reference value)
```

Associates a parameter reference and a data reference with a kernel on a node [*R00818*].

## Parameters

|    |                  |                                                                     |
|----|------------------|---------------------------------------------------------------------|
| in | <i>parameter</i> | The reference to the kernel parameter [ <i>R00819</i> ].            |
| in | <i>value</i>     | The value to associate with the kernel parameter [ <i>R00820</i> ]. |

**Note**

A user may not provide a NULL value for a mandatory parameter of this API.

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [ <i>R00821</i> ].                                                                   |
| <i>VX_ERROR_INVALID_REFERENCE</i> | parameter is not a valid <a href="#">vx_parameter</a> reference, or value is not a valid <a href="#">vx_reference</a> reference.. |

**See also**

[vxGetParameterByIndex](#)

**vxQueryParameter()**

```
vx_status VX_API_CALL vxQueryParameter (
 vx_parameter parameter,
 vx_enum attribute,
 void * ptr,
 vx_size size)
```

Allows the client to query a parameter to determine its meta-information [*R00822*].

**Parameters**

|     |                  |                                                                                                     |
|-----|------------------|-----------------------------------------------------------------------------------------------------|
| in  | <i>parameter</i> | The reference to the parameter [ <i>R00823</i> ].                                                   |
| in  | <i>attribute</i> | The attribute to query. Use a <a href="#">The Parameter Attributes Constants</a> [ <i>R00824</i> ]. |
| out | <i>ptr</i>       | The location at which to store the resulting value [ <i>R00825</i> ].                               |
| in  | <i>size</i>      | The size in bytes of the container to which <i>ptr</i> points [ <i>R00826</i> ].                    |

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                   |                                                                  |
|-----------------------------------|------------------------------------------------------------------|
| <i>VX_SUCCESS</i>                 | No errors; any other value indicates failure [ <i>R00827</i> ].  |
| <i>VX_ERROR_INVALID_REFERENCE</i> | parameter is not a valid <a href="#">vx_parameter</a> reference. |

## 3.71 Advanced Framework API

### 3.71.1 Detailed Description

Describes components that are considered to be advanced.

Advanced topics include: extensions through User Kernels; Reflection and Introspection; Performance Tweaking through Hinting and Directives; and Debugging Callbacks.

#### Modules

- [Framework: Node Callbacks](#)  
*Allows Clients to receive a callback after a specific node has completed execution.*
- [Framework: Performance Measurement](#)  
*Defines Performance measurement and reporting interfaces.*
- [Framework: Log](#)  
*Defines the debug logging interface.*
- [Framework: Hints](#)  
*Defines the Hints Interface.*
- [Framework: Directives](#)  
*Defines the Directives Interface.*
- [Framework: User Kernels](#)  
*Defines the User Kernels, which are a method to extend OpenVX with new vision functions.*
- [Framework: Graph Parameters](#)  
*Defines the Graph Parameter API.*

## 3.72 Framework: Node Callbacks

### 3.72.1 Detailed Description

Allows Clients to receive a callback after a specific node has completed execution.

Callbacks are not guaranteed to be called *immediately* after the Node completes. Callbacks are intended to be used to create simple *early exit* conditions for Vision graphs using [Return code action values](#) return values. An example of setting up a callback can be seen below:

```
vx_graph graph = vxCreateGraph(context);
status = vxGetStatus((vx_reference)graph);
if (status == VX_SUCCESS) {
 vx_uint8 lmin = 0, lmax = 0;
 vx_uint32 minCount = 0, maxCount = 0;
 vx_scalar scalars[] = {
 vxCreateScalar(context, VX_TYPE_UINT8, &lmin),
 vxCreateScalar(context, VX_TYPE_UINT8, &lmax),
 vxCreateScalar(context, VX_TYPE_UINT32, &minCount),
 vxCreateScalar(context, VX_TYPE_UINT32, &maxCount),
 };
 vx_array arrays[] = {
 vxCreateArray(context, VX_TYPE_COORDINATES2D, 1),
 vxCreateArray(context, VX_TYPE_COORDINATES2D, 1)
 };
 vx_node nodes[] = {
 vxMinMaxLocNode(graph, input, scalars[0], scalars[1], arrays[0], arrays[1],
 scalars[2], scalars[3]),
 };
 status = vxAssignNodeCallback(nodes[0], &analyze_brightness);
 // do other
}
```

Once the graph has been initialized and the callback has been installed then the callback itself will be called during graph execution.

```
#define MY_DESIRED_THRESHOLD (10)
vx_action VX_CALLBACK analyze_brightness(vx_node node) {
 // extract the max value
 vx_action action = VX_ACTION_ABANDON;
 vx_parameter pmax = vxGetParameterByIndex(node, 2); // Max Value
 if (pmax) {
 vx_scalar smax = 0;
 vxQueryParameter(pmax, VX_PARAMETER_REF, &smax, sizeof(smax));
 if (smax) {
 vx_uint8 value = 0u;
 vxCopyScalar(smax, &value, VX_READ_ONLY,
 VX_MEMORY_TYPE_HOST);
 if (value >= MY_DESIRED_THRESHOLD) {
 action = VX_ACTION_CONTINUE;
 }
 vxReleaseScalar(&smax);
 }
 vxReleaseParameter(&pmax);
 }
 return action;
}
```

#### Warning

This should be used with **extreme** caution as it can *ruin* optimizations in the power/performance efficiency of a graph.

The callback must return a [vx\\_action](#) code indicating how the graph processing should proceed.

- If [VX\\_ACTION\\_CONTINUE](#) is returned, the graph will continue execution with no changes [R00127].
- If [VX\\_ACTION\\_ABANDON](#) is returned, execution is unspecified for all nodes for which this node is a dominator. Nodes that are dominators of this node will have executed [R00128]. Execution of any other node is unspecified.

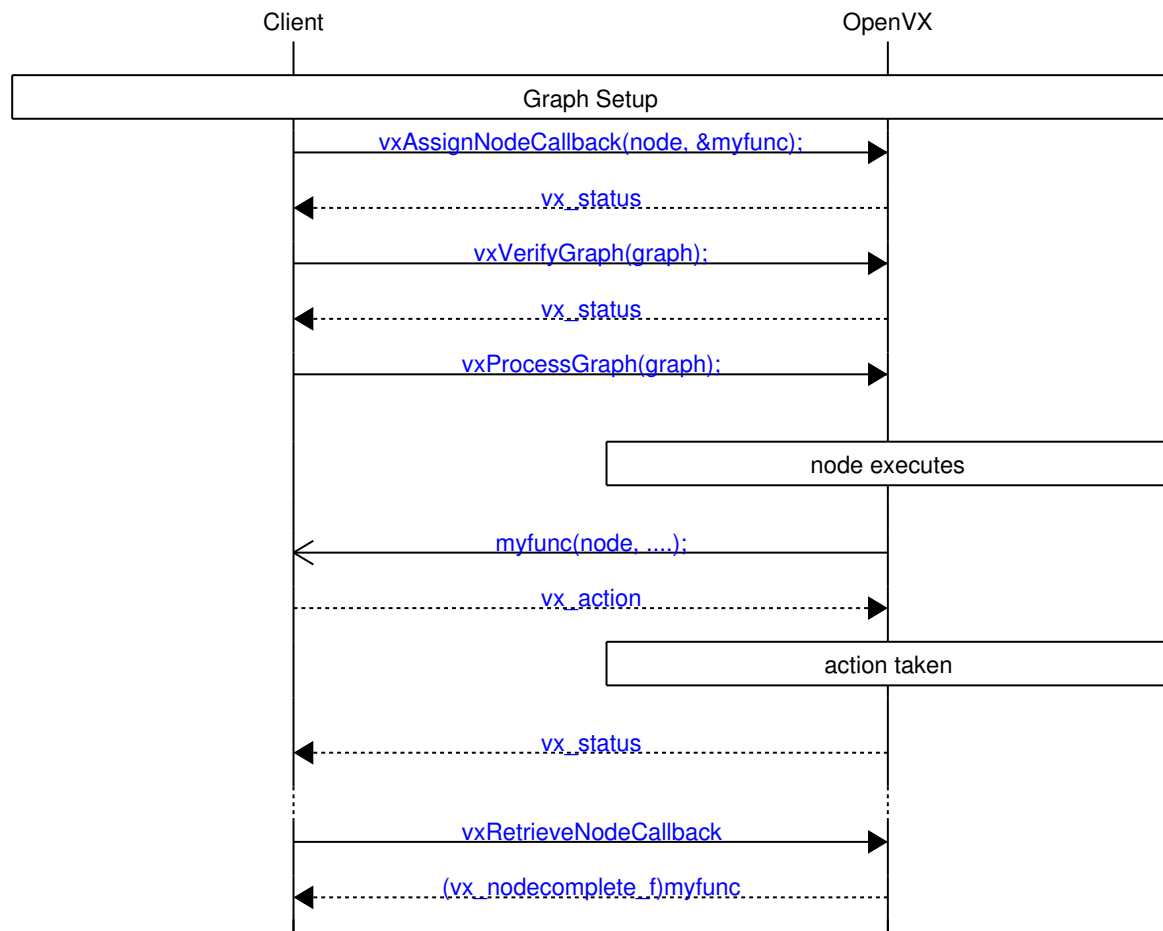

Figure 3.2: Node Callback Sequence

## Modules

- [Return code action values](#)

Possible return values from a [vx\\_nodecomplete\\_f](#) during execution.

## Typedefs

- typedef [vx\\_enum vx\\_action](#)  
The formal typedef of the response from the callback.
- typedef [vx\\_action\(\\* vx\\_nodecomplete\\_f\)](#) ([vx\\_node](#) node)  
A callback to the client after a particular node has completed.

## Functions

- [vx\\_status VX\\_API\\_CALL vxAssignNodeCallback](#) ([vx\\_node](#) node, [vx\\_nodecomplete\\_f](#) callback)  
Assigns a callback to a node. If a callback already exists in this node, this function must return an error [R00782]. The user may clear the callback by passing a NULL pointer as the callback [R00783].
- [vx\\_nodecomplete\\_f VX\\_API\\_CALL vxRetrieveNodeCallback](#) ([vx\\_node](#) node)  
Retrieves the current node callback function pointer set on the node.

### 3.72.2 Typedef Documentation

**vx\_action**

```
typedef vx_enum vx_action
```

The formal typedef of the response from the callback.

See also

[Return code action values](#)

Definition at line [440](#) of file [vx\\_types.h](#).

**vx\_nodecomplete\_f**

```
typedef vx_action(* vx_nodecomplete_f) (vx_node node)
```

A callback to the client after a particular node has completed.

See also

[vx\\_action](#)

[vxAssignNodeCallback](#)

**Parameters**

|    |             |                                              |
|----|-------------|----------------------------------------------|
| in | <i>node</i> | The node to which the callback was attached. |
|----|-------------|----------------------------------------------|

**Returns**

An action code from [Return code action values](#).

Definition at line [449](#) of file [vx\\_types.h](#).

**3.72.3 Function Documentation****vxAssignNodeCallback()**

```
vx_status VX_API_CALL vxAssignNodeCallback (
 vx_node node,
 vx_nodecomplete_f callback)
```

Assigns a callback to a node. If a callback already exists in this node, this function must return an error [*R00782*]. The user may clear the callback by passing a NULL pointer as the callback [*R00783*].

**Parameters**

|    |                 |                                                                                    |
|----|-----------------|------------------------------------------------------------------------------------|
| in | <i>node</i>     | The reference to the node [ <i>R00784</i> ].                                       |
| in | <i>callback</i> | The callback to associate with completion of this specific node [ <i>R00785</i> ]. |

**Warning**

This must be used with **extreme** caution as it can *ruin* optimizations in the power/performance efficiency of a graph.

**Returns**

A [The vx\\_status Constants](#) value.

**Return values**

|                                         |                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | Callback assigned; and other value indicates failure [ <i>R00786</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code> | node is not a valid <code>vx_node</code> reference.                     |

**vxRetrieveNodeCallback()**

```
vx_nodecomplete_f VX_API_CALL vxRetrieveNodeCallback (
 vx_node node)
```

Retrieves the current node callback function pointer set on the node.

**Parameters**

|    |                   |                                                                     |
|----|-------------------|---------------------------------------------------------------------|
| in | <code>node</code> | The reference to the <code>vx_node</code> object [ <i>R00787</i> ]. |
|----|-------------------|---------------------------------------------------------------------|

**Returns**

`vx_nodecomplete_f` The pointer to the callback function.

**Return values**

|                   |                                               |
|-------------------|-----------------------------------------------|
| <code>NULL</code> | No callback is set [ <i>R00788</i> ].         |
| *                 | The node callback function [ <i>R00789</i> ]. |

## 3.73 Framework: Performance Measurement

### 3.73.1 Detailed Description

Defines Performance measurement and reporting interfaces.

In OpenVX, both `vx_graph` objects and `vx_node` objects track performance information. A client can query either object type using their respective `vxQuery<Object>` function with their attribute enumeration `VX_<Object>_PERFORMANCE` along with a `vx_perf_t` structure to obtain the performance information [R00129].

```
vx_perf_t perf;
vxQueryNode(node, VX_NODE_PERFORMANCE, &perf, sizeof(perf));
```

### Data Structures

- struct `vx_perf_t`

*The performance measurement structure. The time or durations are in units of nano seconds. [More...](#)*

### 3.73.2 Data Structure Documentation

#### struct `vx_perf_t`

The performance measurement structure. The time or durations are in units of nano seconds.

Definition at line 1615 of file `vx_types.h`.

#### Data Fields

|                        |                  |                                       |
|------------------------|------------------|---------------------------------------|
| <code>vx_uint64</code> | <code>tmp</code> | Holds the last measurement.           |
| <code>vx_uint64</code> | <code>beg</code> | Holds the first measurement in a set. |
| <code>vx_uint64</code> | <code>end</code> | Holds the last measurement in a set.  |
| <code>vx_uint64</code> | <code>sum</code> | Holds the summation of durations.     |
| <code>vx_uint64</code> | <code>avg</code> | Holds the average of the durations.   |
| <code>vx_uint64</code> | <code>min</code> | Holds the minimum of the durations.   |
| <code>vx_uint64</code> | <code>num</code> | Holds the number of measurements.     |
| <code>vx_uint64</code> | <code>max</code> | Holds the maximum of the durations.   |

## 3.74 Framework: Log

### 3.74.1 Detailed Description

Defines the debug logging interface.

The functions of the debugging interface allow clients to receive important debugging information about OpenVX.

See also

[The vx\\_status Constants](#) for the list of possible errors.

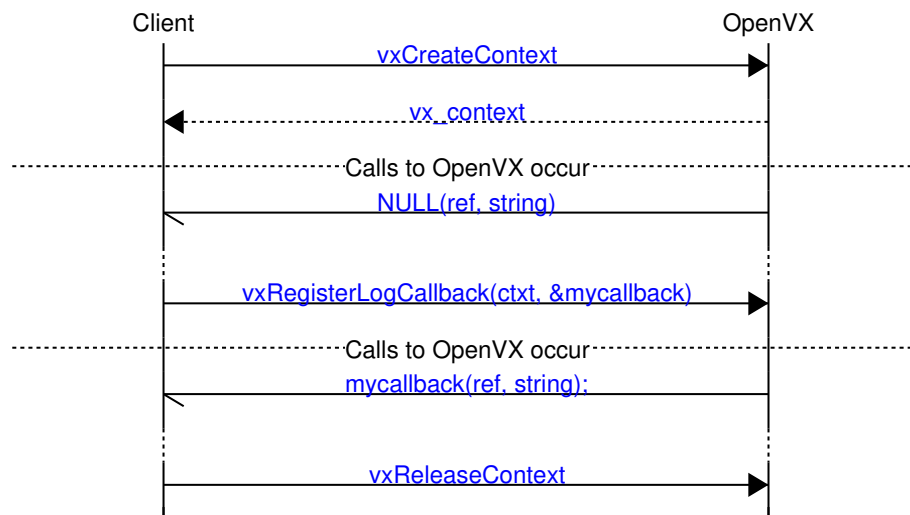

Figure 3.3: Log messages only can be received after the callback is installed.

### Typedefs

- typedef void(\* [vx\\_log\\_callback\\_f](#)) ([vx\\_context](#) context, [vx\\_reference](#) ref, [vx\\_status](#) status, [vx\\_char](#) string[])  
The log callback function [R01650].

### Functions

- void [VX\\_API\\_CALL vxAddLogEntry](#) ([vx\\_reference](#) ref, [vx\\_status](#) status, const char \*message,...)  
Adds a line to the log [R00921].
- void [VX\\_API\\_CALL vxRegisterLogCallback](#) ([vx\\_context](#) context, [vx\\_log\\_callback\\_f](#) callback, [vx\\_bool](#) reentrant)  
Registers a callback facility to the OpenVX implementation to receive error logs [R00928].

### 3.74.2 Function Documentation

#### vxAddLogEntry()

```
void VX_API_CALL vxAddLogEntry (
 vx_reference ref,
 vx_status status,
 const char * message,
 ...)
```

Adds a line to the log [R00921].

**Parameters**

|    |                |                                                                                                      |
|----|----------------|------------------------------------------------------------------------------------------------------|
| in | <i>ref</i>     | The reference to add the log entry against [R00922]. Some valid value must be provided.              |
| in | <i>status</i>  | The status code [R00923]. <code>VX_SUCCESS</code> status entries are ignored and not added [R00924]. |
| in | <i>message</i> | The human readable message to add to the log [R00925].                                               |
| in | ...            | a list of variable arguments to the message [R00926].                                                |

**Note**

Messages may not exceed `VX_MAX_LOG_MESSAGE_LEN` bytes and will be truncated in the log if they exceed this limit [R00927].

**vxRegisterLogCallback()**

```
void VX_API_CALL vxRegisterLogCallback (
 vx_context context,
 vx_log_callback_f callback,
 vx_bool reentrant)
```

Registers a callback facility to the OpenVX implementation to receive error logs [R00928].

**Parameters**

|    |                  |                                                                                                                                                                      |
|----|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i>   | The overall context to OpenVX [R00929].                                                                                                                              |
| in | <i>callback</i>  | The callback function [R00930]. If NULL, the previous callback is removed [R00931].                                                                                  |
| in | <i>reentrant</i> | If reentrancy flag is <code>vx_true_e</code> , then the callback may be entered from multiple simultaneous tasks or threads (if the host OS supports this) [R00932]. |

## 3.75 Framework: Hints

### 3.75.1 Detailed Description

Defines the Hints Interface.

*Hints* are messages given to the OpenVX implementation that it may support. (These are optional.)

#### Modules

- [VX\\_HINT Values](#)

*Values provided to the [vxHint](#) API to enable/disable platform optimizations and/or features. Hints are optional and usually are vendor-specific.*

#### Functions

- [vx\\_status VX\\_API\\_CALL vxHint](#) ([vx\\_reference](#) reference, [vx\\_enum](#) hint, const void \*data, [vx\\_size](#) data\_size)

*Provides a generic API to give platform-specific hints to the implementation.*

### 3.75.2 Function Documentation

#### vxHint()

```
vx_status VX_API_CALL vxHint (
 vx_reference reference,
 vx_enum hint,
 const void * data,
 vx_size data_size)
```

Provides a generic API to give platform-specific hints to the implementation.

#### Parameters

|    |                  |                                                                                                                                                                                                                                |
|----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>reference</i> | The reference to the object to hint at [R00464]. This could be <a href="#">vx_context</a> , <a href="#">vx_graph</a> , <a href="#">vx_node</a> , <a href="#">vx_image</a> , <a href="#">vx_array</a> , or any other reference. |
| in | <i>hint</i>      | A <a href="#">VX_HINT Values</a> <i>hint</i> to give to a <a href="#">vx_context</a> [R00465]. This is a platform-specific optimization or implementation mechanism.                                                           |
| in | <i>data</i>      | Optional vendor specific data [R00466].                                                                                                                                                                                        |
| in | <i>data_size</i> | Size of the data structure <i>data</i> [R00467].                                                                                                                                                                               |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                            |                                                                  |
|--------------------------------------------|------------------------------------------------------------------|
| <a href="#">VX_SUCCESS</a>                 | No error; any other value indicates failure [R00468].            |
| <a href="#">VX_ERROR_INVALID_REFERENCE</a> | reference is not a valid <a href="#">vx_reference</a> reference. |
| <a href="#">VX_ERROR_NOT_SUPPORTED</a>     | If the hint is not supported.                                    |

## 3.76 Framework: Directives

### 3.76.1 Detailed Description

Defines the Directives Interface.

*Directives* are messages given the OpenVX implementation that it must support. (These are required, i.e., non-optional.)

### Functions

- `vx_status VX_API_CALL vxDirective (vx_reference reference, vx_enum directive)`

*Provides a generic API to give platform-specific directives to the implementations.*

### 3.76.2 Function Documentation

#### vxDirective()

```
vx_status VX_API_CALL vxDirective (
 vx_reference reference,
 vx_enum directive)
```

Provides a generic API to give platform-specific directives to the implementations.

#### Parameters

|    |                  |                                                                                                                                                                                                                              |
|----|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>reference</i> | The reference to the object to set the directive on [R00469]. This could be <code>vx_context</code> , <code>vx_graph</code> , <code>vx_node</code> , <code>vx_image</code> , <code>vx_array</code> , or any other reference. |
| in | <i>directive</i> | The directive to set [R00470]. See <a href="#">List of allowed directives</a> .                                                                                                                                              |

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                         |                                                               |
|-----------------------------------------|---------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00471].        |
| <code>VX_ERROR_INVALID_REFERENCE</code> | reference is not a valid <code>vx_reference</code> reference. |
| <code>VX_ERROR_NOT_SUPPORTED</code>     | If the directive is not supported.                            |

#### Note

The performance counter directives are only available for the reference `vx_context` [R00472]. Error `VX_ERROR_NOT_SUPPORTED` is returned when used with any other reference [R00473].

## 3.77 Framework: User Kernels

### 3.77.1 Detailed Description

Defines the User Kernels, which are a method to extend OpenVX with new vision functions.

User Kernels can be loaded by OpenVX and included as nodes in the graph. User Kernels will typically be loaded and executed on High Level Operating System/CPU compatible targets, not on remote processors or other accelerators. This specification does not mandate what constitutes compatible platforms.

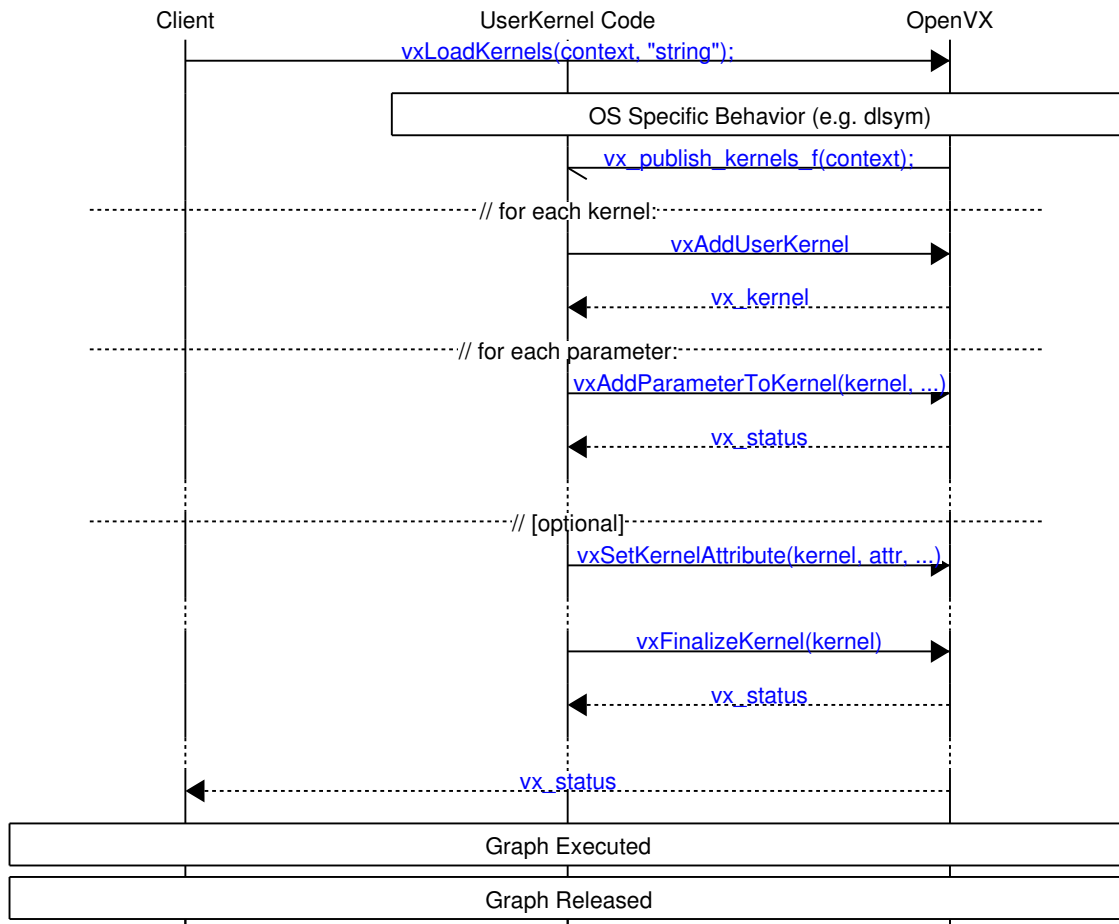

Figure 3.4: Call sequence of User Kernels Installation

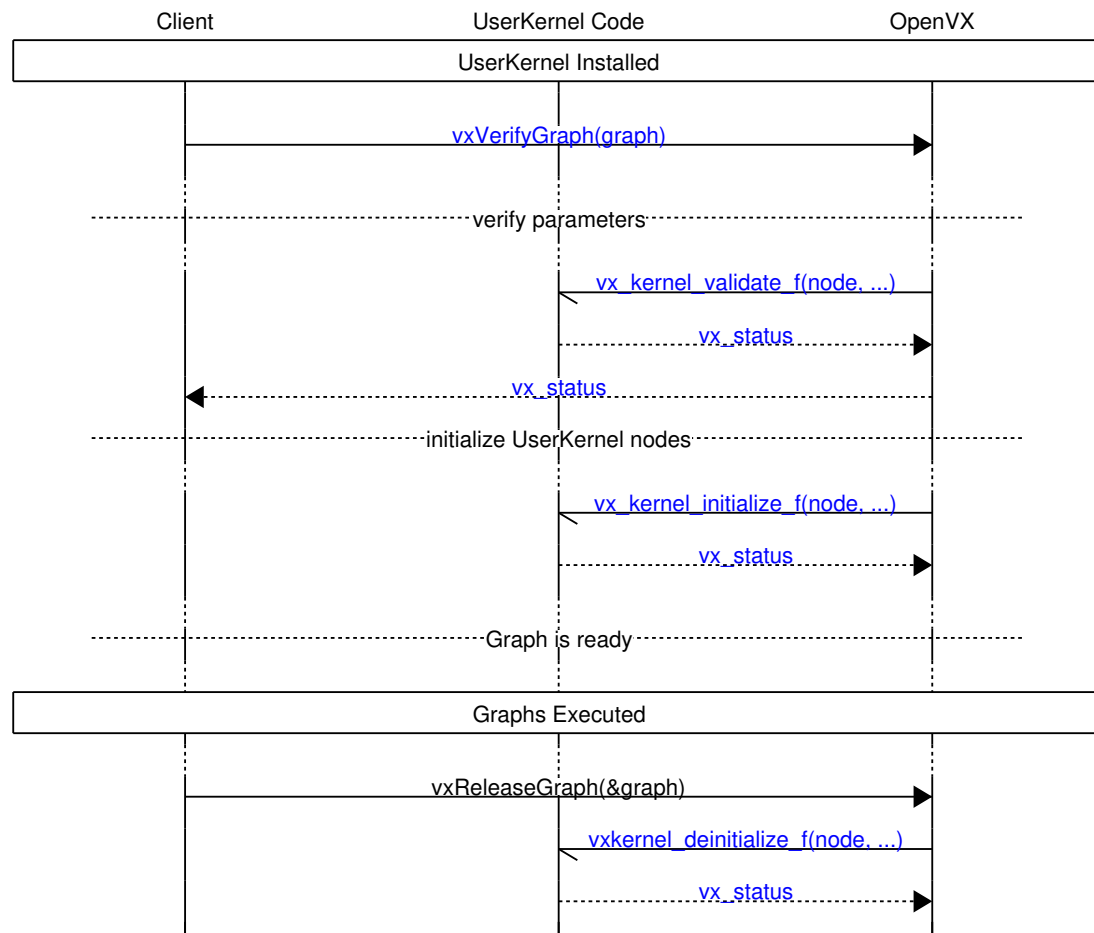

Figure 3.5: Call sequence of a Graph Verify and Release with User Kernels.

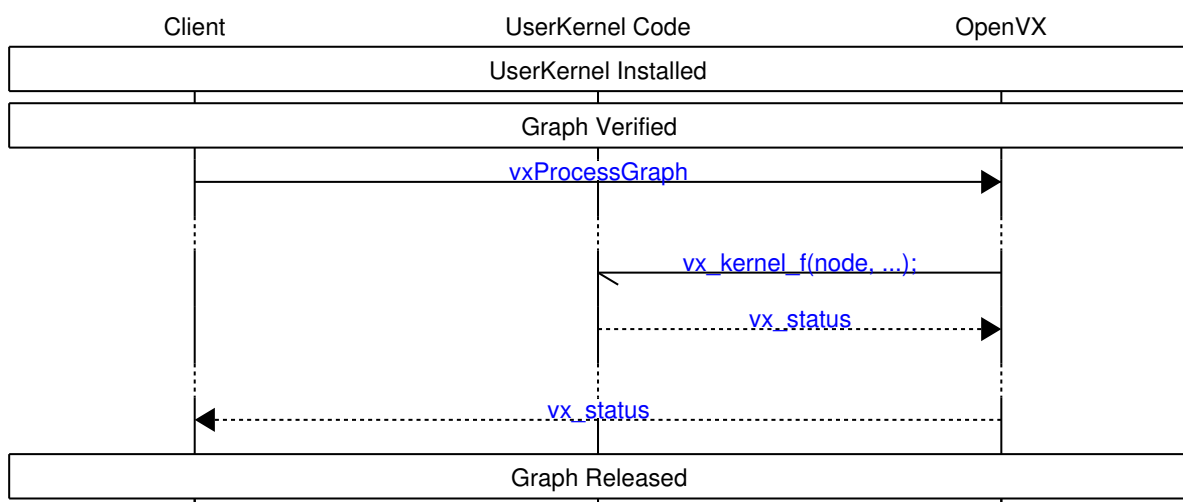

Figure 3.6: Call sequence of a Graph Execution with User Kernels

During the first graph verification, the implementation will perform the following action sequence:

1. Initialize local data node attributes

- If `VX_KERNEL_LOCAL_DATA_SIZE == 0`, then set `VX_NODE_LOCAL_DATA_SIZE` to 0 and set `VX_NODE_LOCAL_DATA_PTR` to NULL [R00130].
  - If `VX_KERNEL_LOCAL_DATA_SIZE != 0`, set `VX_NODE_LOCAL_DATA_SIZE` to `VX_KERNEL_LOCAL_DATA_SIZE` and set `VX_NODE_LOCAL_DATA_PTR` to the address of a buffer of `VX_KERNEL_LOCAL_DATA_SIZE` bytes [R00131].
2. Call the `vx_kernel_validate_f` callback [R00132].
  3. Call the `vx_kernel_initialize_f` callback (if not NULL) [R00133]:
    - If `VX_KERNEL_LOCAL_DATA_SIZE == 0`, the callback is allowed to set `VX_NODE_LOCAL_DATA_SIZE` and `VX_NODE_LOCAL_DATA_PTR`.
    - If `VX_KERNEL_LOCAL_DATA_SIZE != 0`, then any attempt by the callback to set `VX_NODE_LOCAL_DATA_SIZE` or `VX_NODE_LOCAL_DATA_PTR` attributes will generate an error [R00134].
  4. Provide the buffer optionally requested by the application
    - If `VX_KERNEL_LOCAL_DATA_SIZE == 0` and `VX_NODE_LOCAL_DATA_SIZE != 0`, and `VX_NODE_LOCAL_DATA_PTR == NULL`, then the implementation will set `VX_NODE_LOCAL_DATA_PTR` to the address of a buffer of `VX_NODE_LOCAL_DATA_SIZE` bytes [R00135].

At node destruction time, the implementation will perform the following action sequence:

1. Call `vx_kernel_deinitialize_f` callback (if not NULL) [R00136]: If the `VX_NODE_LOCAL_DATA_PTR` was set earlier by the implementation, then any attempt by the callback to set the `VX_NODE_LOCAL_DATA_PTR` attributes will generate an error [R00137].
2. If the `VX_NODE_LOCAL_DATA_PTR` was set earlier by the implementation, then the pointed memory must not be used anymore by the application after the `vx_kernel_deinitialize_f` callback completes.

A user node requires re-verification, if any changes below occurred after the last node verification:

1. The `VX_NODE_BORDER` node attribute was modified.
2. At least one of the node parameters was replaced by a data object with different meta-data, or was replaced by the 0 reference for optional parameters, or was set to a data object if previously not set because optional.

The node re-verification can be triggered explicitly by the application by calling `vxVerifyGraph` that will perform a complete graph verification [R00138]. Otherwise, it will be triggered automatically at the next graph execution [R00139].

During user node re-verification, the following action sequence will occur:

1. Call the `vx_kernel_deinitialize_f` callback (if not NULL) [R00140]: If the `VX_NODE_LOCAL_DATA_PTR` was set earlier by the OpenVX implementation, then any attempt by the callback to set the `VX_NODE_LOCAL_DATA_PTR` attributes will generate an error [R00141].
2. Reinitialize local data node attributes if needed If `VX_KERNEL_LOCAL_DATA_SIZE == 0`:
  - set `VX_NODE_LOCAL_DATA_PTR` to NULL [R00142].
  - set `VX_NODE_LOCAL_DATA_SIZE` to 0 [R00143].
3. Call the `vx_kernel_validate_f` callback [R00144].
4. Call the `vx_kernel_initialize_f` callback (if not NULL) [R00145]:
  - If `VX_KERNEL_LOCAL_DATA_SIZE == 0`, the callback is allowed to set `VX_NODE_LOCAL_DATA_SIZE` and `VX_NODE_LOCAL_DATA_PTR`.
  - If `VX_KERNEL_LOCAL_DATA_SIZE != 0`, then any attempt by the callback to set `VX_NODE_LOCAL_DATA_SIZE` or `VX_NODE_LOCAL_DATA_PTR` attributes will generate an error [R00146].
5. Provide the buffer optionally requested by the application
  - If `VX_KERNEL_LOCAL_DATA_SIZE == 0` and `VX_NODE_LOCAL_DATA_SIZE != 0`, and `VX_NODE_LOCAL_DATA_PTR == NULL`, then the OpenVX implementation will set `VX_NODE_LOCAL_DATA_PTR` to the address of a buffer of `VX_NODE_LOCAL_DATA_SIZE` bytes [R00147].

When an OpenVX implementation sets the `VX_NODE_LOCAL_DATA_PTR`, the data inside the buffer will not be persistent between kernel executions.

## Modules

- [The meta valid rectangle attributes.](#)

*The meta valid rectangle attributes.*

## Typedefs

- typedef [vx\\_status](#)(\* [vx\\_kernel\\_deinitialize\\_f](#)) ([vx\\_node](#) node, [vx\\_reference](#) \*parameters, [vx\\_uint32](#) num)  
*The pointer to the kernel deinitializer [R01618]. If the host code requires a call to deinitialize data during a node garbage collection, this function is called if not NULL [R01619].*
- typedef [vx\\_status](#)(\* [vx\\_kernel\\_f](#)) ([vx\\_node](#) node, [vx\\_reference](#) \*parameters, [vx\\_uint32](#) num)  
*The pointer to the Host side kernel [R01609].*
- typedef [vx\\_status](#)(\* [vx\\_kernel\\_image\\_valid\\_rectangle\\_f](#)) ([vx\\_node](#) node, [vx\\_uint32](#) index, [vx\\_rectangle\\_t](#) \*input\_valid[], [vx\\_rectangle\\_t](#) \*output\_valid[])  
*A user-defined callback function to set the valid rectangle of an output image [R01631].*
- typedef [vx\\_status](#)(\* [vx\\_kernel\\_initialize\\_f](#)) ([vx\\_node](#) node, [vx\\_reference](#) \*parameters, [vx\\_uint32](#) num)  
*The pointer to the kernel initializer [R01613]. If the host code requires a call to initialize data once all the parameters have been validated, this function is called if not NULL [R01614].*
- typedef [vx\\_status](#)(\* [vx\\_kernel\\_validate\\_f](#)) ([vx\\_node](#) node, [vx\\_reference](#) parameters[], [vx\\_uint32](#) num, [vx\\_meta\\_format](#) metas[])  
*The user-defined kernel node parameters validation function [R01623]. The function only needs to fill in the meta data structure(s) [R01624].*
- typedef struct [\\_vx\\_meta\\_format](#) \* [vx\\_meta\\_format](#)  
*This object is used by output validation functions to specify the meta data of the expected output data object.*
- typedef [vx\\_status](#)(\* [vx\\_publish\\_kernels\\_f](#)) ([vx\\_context](#) context)  
*The type of the [vxPublishKernels](#) entry function of modules loaded by [vxLoadKernels](#) and unloaded by [vxUnloadKernels](#) [R01605].*
- typedef [vx\\_status](#)(\* [vx\\_unpublish\\_kernels\\_f](#)) ([vx\\_context](#) context)  
*The type of the [vxUnpublishKernels](#) entry function of modules loaded by [vxLoadKernels](#) and unloaded by [vxUnloadKernels](#) [R01607].*

## Functions

- [vx\\_status VX\\_API\\_CALL vxAddParameterToKernel](#) ([vx\\_kernel](#) kernel, [vx\\_uint32](#) index, [vx\\_enum](#) dir, [vx\\_enum](#) data\_type, [vx\\_enum](#) state)  
*Allows users to set the signatures of the custom kernel [R00685].*
- [vx\\_kernel VX\\_API\\_CALL vxAddUserKernel](#) ([vx\\_context](#) context, const [vx\\_char](#) name[VX\_MAX\_KERNEL\_NAME], [vx\\_enum](#) enumeration, [vx\\_kernel\\_f](#) func\_ptr, [vx\\_uint32](#) numParams, [vx\\_kernel\\_validate\\_f](#) validate, [vx\\_kernel\\_initialize\\_f](#) init, [vx\\_kernel\\_deinitialize\\_f](#) deinit)  
*Allows users to add custom kernels to a context at run-time [R00671].*
- [vx\\_status VX\\_API\\_CALL vxAllocateUserKernelId](#) ([vx\\_context](#) context, [vx\\_enum](#) \*pKernelEnumId)  
*Allocates and registers user-defined kernel identifier to a context. The allocated identifier is from available pool of 4096 values reserved for dynamic allocation from [VX\\_KERNEL\\_BASE\(VX\\_ID\\_USER,0\)](#) [R00480].*
- [vx\\_status VX\\_API\\_CALL vxAllocateUserKernelLibraryId](#) ([vx\\_context](#) context, [vx\\_enum](#) \*pLibraryId)  
*Allocates and registers user-defined kernel library ID to a context.*
- [vx\\_status VX\\_API\\_CALL vxFinalizeKernel](#) ([vx\\_kernel](#) kernel)  
*This API is called after all parameters have been added to the kernel and the kernel is ready to be used [R00682]. Notice that the reference to the kernel created by [vxAddUserKernel](#) is still valid after the call to [vxFinalizeKernel](#). If an error occurs, the kernel is not available for usage by the clients of OpenVX [R00683]. Typically this is due to a mismatch between the number of parameters requested and given.*
- [vx\\_status VX\\_API\\_CALL vxLoadKernels](#) ([vx\\_context](#) context, const [vx\\_char](#) \*module)  
*Loads a library of kernels, called module, into a context [R00635].*
- [vx\\_status VX\\_API\\_CALL vxRemoveKernel](#) ([vx\\_kernel](#) kernel)  
*Removes a custom kernel from its context and releases it [R00692].*

- `vx_status VX_API_CALL vxSetKernelAttribute` (`vx_kernel` kernel, `vx_enum` attribute, `const void *ptr`, `vx_size` size)  
*Sets kernel attributes [R00696].*
- `vx_status VX_API_CALL vxSetMetaFormatAttribute` (`vx_meta_format` meta, `vx_enum` attribute, `const void *ptr`, `vx_size` size)  
*This function allows a user to set the attributes of a `vx_meta_format` object in a kernel output validator.*
- `vx_status VX_API_CALL vxSetMetaFormatFromReference` (`vx_meta_format` meta, `vx_reference` exemplar)  
*Set a meta format object from an exemplar data object reference.*
- `vx_status VX_API_CALL vxUnloadKernels` (`vx_context` context, `const vx_char *module`)  
*Unloads all kernels from the OpenVX context that had been loaded from the module using the `vxLoadKernels` function [R00646].*

### 3.77.2 Typedef Documentation

#### `vx_meta_format`

```
typedef struct _vx_meta_format* vx_meta_format
```

This object is used by output validation functions to specify the meta data of the expected output data object.

#### Note

When the actual output object of the user node is virtual, the information given through the `vx_meta_format` object allows the OpenVX framework to automatically create the data object when meta data were not specified by the application at object creation time.

Definition at line 317 of file `vx_types.h`.

#### `vx_publish_kernels_f`

```
typedef vx_status(* vx_publish_kernels_f) (vx_context context)
```

The type of the `vxPublishKernels` entry function of modules loaded by `vxLoadKernels` and unloaded by `vxUnloadKernels` [R01605].

#### Parameters

|    |                      |                                                                 |
|----|----------------------|-----------------------------------------------------------------|
| in | <code>context</code> | The reference to the context kernels must be added to [R01606]. |
|----|----------------------|-----------------------------------------------------------------|

Definition at line 1737 of file `vx_types.h`.

#### `vx_unpublish_kernels_f`

```
typedef vx_status(* vx_unpublish_kernels_f) (vx_context context)
```

The type of the `vxUnpublishKernels` entry function of modules loaded by `vxLoadKernels` and unloaded by `vxUnloadKernels` [R01607].

#### Parameters

|    |                      |                                                                   |
|----|----------------------|-------------------------------------------------------------------|
| in | <code>context</code> | The reference to the context kernels have been added to [R01608]. |
|----|----------------------|-------------------------------------------------------------------|

Definition at line 1745 of file `vx_types.h`.

**vx\_kernel\_f**

typedef `vx_status` ( \* `vx_kernel_f`) (`vx_node` node, `vx_reference` \*parameters, `vx_uint32` num)  
 The pointer to the Host side kernel [R01609].

**Parameters**

|    |                   |                                                            |
|----|-------------------|------------------------------------------------------------|
| in | <i>node</i>       | The handle to the node that contains this kernel [R01610]. |
| in | <i>parameters</i> | The array of parameter references [R01611].                |
| in | <i>num</i>        | The number of parameters [R01612].                         |

Definition at line 1754 of file `vx_types.h`.

**vx\_kernel\_initialize\_f**

typedef `vx_status` ( \* `vx_kernel_initialize_f`) (`vx_node` node, `vx_reference` \*parameters, `vx_uint32` num)

The pointer to the kernel initializer [R01613]. If the host code requires a call to initialize data once all the parameters have been validated, this function is called if not NULL [R01614].

**Parameters**

|    |                   |                                                            |
|----|-------------------|------------------------------------------------------------|
| in | <i>node</i>       | The handle to the node that contains this kernel [R01615]. |
| in | <i>parameters</i> | The array of parameter references [R01616].                |
| in | <i>num</i>        | The number of parameters [R01617].                         |

Definition at line 1765 of file `vx_types.h`.

**vx\_kernel\_deinitialize\_f**

typedef `vx_status` ( \* `vx_kernel_deinitialize_f`) (`vx_node` node, `vx_reference` \*parameters, `vx_uint32` num)

The pointer to the kernel deinitializer [R01618]. If the host code requires a call to deinitialize data during a node garbage collection, this function is called if not NULL [R01619].

**Parameters**

|    |                   |                                                            |
|----|-------------------|------------------------------------------------------------|
| in | <i>node</i>       | The handle to the node that contains this kernel [R01620]. |
| in | <i>parameters</i> | The array of parameter references [R01621].                |
| in | <i>num</i>        | The number of parameters [R01622].                         |

Definition at line 1776 of file `vx_types.h`.

**vx\_kernel\_validate\_f**

typedef `vx_status` ( \* `vx_kernel_validate_f`) (`vx_node` node, `vx_reference` parameters[], `vx_uint32` num, `vx_meta_format` metas[])

The user-defined kernel node parameters validation function [R01623]. The function only needs to fill in the meta data structure(s) [R01624].

**Note**

This function is called once for whole set of parameters [R01625].

**Parameters**

|    |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>node</i>       | The handle to the node that is being validated [R01626].                                                                                                                                                                                                                                                                                                                                                                          |
| in | <i>parameters</i> | The array of parameters to be validated [R01627].                                                                                                                                                                                                                                                                                                                                                                                 |
| in | <i>num</i>        | Number of parameters to be validated [R01628].                                                                                                                                                                                                                                                                                                                                                                                    |
| in | <i>metas</i>      | A pointer to a pre-allocated array of structure references that the system holds. The system pre-allocates a number of <code>vx_meta_format</code> structures for the output parameters only, indexed by the same indices as <code>parameters[]</code> [R01629]. The validation function fills in the correct type, format, and dimensionality for the system to use either to create memory or to check against existing memory. |

**Returns**

An error code describing the validation status on parameters [R01630].

Definition at line 1792 of file `vx_types.h`.

**vx\_kernel\_image\_valid\_rectangle\_f**

```
typedef vx_status (* vx_kernel_image_valid_rectangle_f) (vx_node node, vx_uint32 index, vx_rectangle_t * input_valid[], vx_rectangle_t * output_valid[])
```

A user-defined callback function to set the valid rectangle of an output image [R01631].

The `VX_VALID_RECT_CALLBACK` attribute in the `vx_meta_format` object should be set to the desired callback during user node's output validator [R01632]. The callback must not call `vxGetValidRegionImage` or `vxSetImageValidRectangle` [R01633]. Instead, an array of the valid rectangles of all the input images is supplied to the callback to calculate the output valid rectangle [R01634]. The output of the user node may be a pyramid, or just an image. If it is just an image, the 'Out' array associated with that output only has one element [R01635]. If the output is a pyramid, the array size is equal to the number of pyramid levels [R01636]. Notice that the array memory allocation passed to the callback is managed by the framework, the application must not allocate or deallocate those pointers [R01637].

The behavior of the callback function `vx_kernel_image_valid_rectangle_f` is undefined if one of the following is true:

- One of the input arguments of a user node is a pyramid or an array of images [R01638].
- Either input or output argument of a user node is an array of pyramids [R01639].

**Parameters**

|         |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in, out | <i>node</i>         | The handle to the node that is being validated [R01640].                                                                                                                                                                                                                                                                                                                                                                                                               |
| in      | <i>index</i>        | The index of the output parameter for which a valid region should be set [R01641].                                                                                                                                                                                                                                                                                                                                                                                     |
| in      | <i>input_valid</i>  | A pointer to an array of valid regions of input images or images contained in image container (e.g. pyramids) [R01642]. They are provided in same order as the parameter list of the kernel's declaration [R01643].                                                                                                                                                                                                                                                    |
| out     | <i>output_valid</i> | An array of valid regions that should be set for the output images or image containers (e.g. pyramid) after graph processing [R01644]. The length of the array should be equal to the size of the image container (e.g. number of levels in the pyramid) [R01645]. For a simple output image the array size is always one [R01646]. Each rectangle supplies the valid region for one image [R01647]. The array memory allocation is managed by the framework [R01648]. |

**Returns**

An error code describing the validation status on parameters [R01649].

Definition at line 1825 of file `vx_types.h`.

### 3.77.3 Function Documentation

#### vxAllocateUserKernelId()

```
vx_status VX_API_CALL vxAllocateUserKernelId (
 vx_context context,
 vx_enum * pKernelEnumId)
```

Allocates and registers user-defined kernel identifier to a context. The allocated identifier is from available pool of 4096 values reserved for dynamic allocation from `VX_KERNEL_BASE(VX_ID_USER,0)` [R00480].

##### Parameters

|     |                      |                                                                          |
|-----|----------------------|--------------------------------------------------------------------------|
| in  | <i>context</i>       | The reference to the implementation context [R00481].                    |
| out | <i>pKernelEnumId</i> | pointer to return <code>vx_enum</code> for user-defined kernel [R00482]. |

##### Return values

|                                         |                                                                  |
|-----------------------------------------|------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00483].           |
| <code>VX_ERROR_INVALID_REFERENCE</code> | If the context is not a valid <code>vx_context</code> reference. |
| <code>VX_ERROR_NO_RESOURCES</code>      | No more kernel identifier values are available.                  |

#### vxAllocateUserKernelLibraryId()

```
vx_status VX_API_CALL vxAllocateUserKernelLibraryId (
 vx_context context,
 vx_enum * pLibraryId)
```

Allocates and registers user-defined kernel library ID to a context.

The allocated library ID is from available pool of library IDs (1..255) reserved for dynamic allocation [R00484]. The returned libraryId can be used by user-kernel library developer to specify individual kernel enum IDs in a header file, shown below:

```
#define MY_KERNEL_ID1(libraryId) (VX_KERNEL_BASE(VX_ID_USER,libraryId) + 0);
#define MY_KERNEL_ID2(libraryId) (VX_KERNEL_BASE(VX_ID_USER,libraryId) + 1);
#define MY_KERNEL_ID3(libraryId) (VX_KERNEL_BASE(VX_ID_USER,libraryId) + 2);
```

##### Parameters

|     |                   |                                                                     |
|-----|-------------------|---------------------------------------------------------------------|
| in  | <i>context</i>    | The reference to the implementation context [R00485].               |
| out | <i>pLibraryId</i> | pointer to <code>vx_enum</code> for user-kernel libraryId [R00486]. |

##### Return values

|                                    |                                                        |
|------------------------------------|--------------------------------------------------------|
| <code>VX_SUCCESS</code>            | No errors; any other value indicates failure [R00487]. |
| <code>VX_ERROR_NO_RESOURCES</code> | No more library IDs are available.                     |

#### vxLoadKernels()

```
vx_status VX_API_CALL vxLoadKernels (
```

```
vx_context context,
const vx_char * module)
```

Loads a library of kernels, called module, into a context [R00635].

The module must be a dynamic library by convention, with two exported functions named vxPublishKernels and vxUnpublishKernels.

vxPublishKernels must have type vx\_publish\_kernels\_f [R00636], and must add kernels to the context by calling vxAddUserKernel [R00637] for each new kernel. vxPublishKernels is called by vxLoadKernels [R00638].

vxUnpublishKernels must have type vx\_unpublish\_kernels\_f [R00639], and must remove kernels from the context by calling vxRemoveKernel [R00640] for each kernel the vxPublishKernels has added [R00641]. vxUnpublishKernels is called by vxUnloadKernels [R00642].

#### Note

When all references to loaded kernels are released, the module may be automatically unloaded.

#### Parameters

|    |         |                                                                                                                                                                                                                                                                                                          |
|----|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | context | The reference to the context the kernels must be added to [R00643].                                                                                                                                                                                                                                      |
| in | module  | The short name of the module to load [R00644]. On systems where there are specific naming conventions for modules, the name passed should ignore such conventions. For example: libxyz.so should be passed as just xyz and the implementation will <i>do the right thing</i> that the platform requires. |

#### Note

This API uses the system pre-defined paths for modules.

#### Returns

A The vx\_status Constants value.

#### Return values

|                             |                                                        |
|-----------------------------|--------------------------------------------------------|
| VX_SUCCESS                  | No errors; any other value indicates failure [R00645]. |
| VX_ERROR_INVALID_REFERENCE  | context is not a valid vx_context reference.           |
| VX_ERROR_INVALID_PARAMETERS | If any of the other parameters are incorrect.          |

#### See also

vxGetKernelByName

#### vxUnloadKernels()

```
vx_status VX_API_CALL vxUnloadKernels (
 vx_context context,
 const vx_char * module)
```

Unloads all kernels from the OpenVX context that had been loaded from the module using the vxLoadKernels function [R00646].

The kernel unloading is performed by calling the vxUnpublishKernels exported function of the module.

#### Note

vxUnpublishKernels is defined in the description of vxLoadKernels.

**Parameters**

|    |                |                                                                                                                                                                                                                                                                                                                                      |
|----|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>context</i> | The reference to the context the kernels must be removed from [R00647].                                                                                                                                                                                                                                                              |
| in | <i>module</i>  | The short name of the module to unload [R00648]. On systems where there are specific naming conventions for modules, the name passed should ignore such conventions. For example: <code>libxyz.so</code> should be passed as just <code>xyz</code> and the implementation will <i>do the right thing</i> that the platform requires. |

**Note**

This API uses the system pre-defined paths for modules.

**Returns**

A The `vx_status` Constants value.

**Return values**

|                                          |                                                           |
|------------------------------------------|-----------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00649].    |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | context is not a valid <code>vx_context</code> reference. |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If any of the other parameters are incorrect.             |

**See also**

[vxLoadKernels](#)

**vxAddUserKernel()**

```
vx_kernel VX_API_CALL vxAddUserKernel (
 vx_context context,
 const vx_char name[VX_MAX_KERNEL_NAME],
 vx_enum enumeration,
 vx_kernel_f func_ptr,
 vx_uint32 numParams,
 vx_kernel_validate_f validate,
 vx_kernel_initialize_f init,
 vx_kernel_deinitialize_f deinit)
```

Allows users to add custom kernels to a context at run-time [R00671].

**Parameters**

|    |                    |                                                                                                       |
|----|--------------------|-------------------------------------------------------------------------------------------------------|
| in | <i>context</i>     | The reference to the context the kernel must be added to [R00672].                                    |
| in | <i>name</i>        | The string to use to match the kernel [R00673].                                                       |
| in | <i>enumeration</i> | The enumerated value of the kernel to be used by clients [R00674].                                    |
| in | <i>func_ptr</i>    | The process-local function pointer to be invoked [R00675].                                            |
| in | <i>numParams</i>   | The number of parameters for this kernel [R00676].                                                    |
| in | <i>validate</i>    | The pointer to <code>vx_kernel_validate_f</code> [R00677], which validates parameters to this kernel. |
| in | <i>init</i>        | The kernel initialization function [R00678].                                                          |
| in | <i>deinit</i>      | The kernel de-initialization function [R00679].                                                       |

## Returns

A `vx_kernel` reference [R00680]. Any possible errors preventing a successful creation should be checked using `vxGetStatus` [R00681].

**vxFinalizeKernel()**

```
vx_status VX_API_CALL vxFinalizeKernel (
 vx_kernel kernel)
```

This API is called after all parameters have been added to the kernel and the kernel is *ready* to be used [R00682]. Notice that the reference to the kernel created by `vxAddUserKernel` is still valid after the call to `vxFinalizeKernel`. If an error occurs, the kernel is not available for usage by the clients of OpenVX [R00683]. Typically this is due to a mismatch between the number of parameters requested and given.

## Parameters

|    |               |                                                                        |
|----|---------------|------------------------------------------------------------------------|
| in | <i>kernel</i> | The reference to the loaded kernel from <code>vxAddUserKernel</code> . |
|----|---------------|------------------------------------------------------------------------|

## Returns

A `The vx_status Constants` value.

## Return values

|                                         |                                                         |
|-----------------------------------------|---------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00684].  |
| <code>VX_ERROR_INVALID_REFERENCE</code> | kernel is not a valid <code>vx_kernel</code> reference. |

## Precondition

`vxAddUserKernel` and `vxAddParameterToKernel`

**vxAddParameterToKernel()**

```
vx_status VX_API_CALL vxAddParameterToKernel (
 vx_kernel kernel,
 vx_uint32 index,
 vx_enum dir,
 vx_enum data_type,
 vx_enum state)
```

Allows users to set the signatures of the custom kernel [R00685].

## Parameters

|    |                  |                                                                                                                                                                                  |
|----|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>kernel</i>    | The reference to the kernel added with <code>vxAddUserKernel</code> [R00686].                                                                                                    |
| in | <i>index</i>     | The index of the parameter to add [R00687].                                                                                                                                      |
| in | <i>dir</i>       | The direction of the parameter. This must be either <code>VX_INPUT</code> or <code>VX_OUTPUT</code> . <code>VX_BIDIRECTIONAL</code> is not supported for this function [R00688]. |
| in | <i>data_type</i> | The type of parameter. This must be a value from <code>The VX_TYPE Constants</code> [R00689].                                                                                    |
| in | <i>state</i>     | The state of the parameter (required or not). This must be a value from <code>The parameter state type constants</code> ..                                                       |

## Returns

A The `vx_status Constants` value [R00690].

## Return values

|                                          |                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | Parameter is successfully set on kernel; any other value indicates failure [R00691]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | kernel is not a valid <code>vx_kernel</code> reference.                              |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If the parameter is not valid for any reason.                                        |

## Precondition

`vxAddUserKernel`

**vxRemoveKernel()**

```
vx_status VX_API_CALL vxRemoveKernel (
 vx_kernel kernel)
```

Removes a custom kernel from its context and releases it [R00692].

## Parameters

|    |                     |                                                                                              |
|----|---------------------|----------------------------------------------------------------------------------------------|
| in | <code>kernel</code> | The reference to the kernel to remove [R00693]. Returned from <code>vxAddUserKernel</code> . |
|----|---------------------|----------------------------------------------------------------------------------------------|

## Note

Any kernel enumerated in the base standard cannot be removed; only kernels added through `vxAddUserKernel` can be removed [R00694].

## Returns

A The `vx_status Constants` value. The function returns to the application full control over the memory resources provided at the kernel creation time.

## Return values

|                                          |                                                                                                                                                                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | No errors; any other value indicates failure [R00695].                                                                                                                                                                                                                        |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | kernel is not a valid <code>vx_kernel</code> reference.                                                                                                                                                                                                                       |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | If a base kernel is passed in.                                                                                                                                                                                                                                                |
| <code>VX_FAILURE</code>                  | If the application has not released all references to the kernel object OR if the application has not released all references to a node that is using this kernel OR if the application has not released all references to a graph which has nodes that is using this kernel. |

**vxSetKernelAttribute()**

```
vx_status VX_API_CALL vxSetKernelAttribute (
 vx_kernel kernel,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

Sets kernel attributes [R00696].

#### Parameters

|    |                  |                                                                                              |
|----|------------------|----------------------------------------------------------------------------------------------|
| in | <i>kernel</i>    | The reference to the kernel [R00697].                                                        |
| in | <i>attribute</i> | The attribute to query, use a <a href="#">The Kernel Attribute Constants</a> value [R00698]. |
| in | <i>ptr</i>       | The pointer to the location from which to read the attribute [R00699].                       |
| in | <i>size</i>      | The size in bytes of the data area indicated by <i>ptr</i> in byte [R00700]s.                |

#### Note

After a kernel has been passed to `vxFinalizeKernel`, no attributes can be altered [R00701].

#### Returns

A [The vx\\_status Constants](#) value.

#### Return values

|                                         |                                                            |
|-----------------------------------------|------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | No errors; any other value indicates failure [R00702].     |
| <code>VX_ERROR_INVALID_REFERENCE</code> | kernel is not a valid <a href="#">vx_kernel</a> reference. |

#### `vxSetMetaFormatAttribute()`

```
vx_status VX_API_CALL vxSetMetaFormatAttribute (
 vx_meta_format meta,
 vx_enum attribute,
 const void * ptr,
 vx_size size)
```

This function allows a user to set the attributes of a [vx\\_meta\\_format](#) object in a kernel output validator.

The [vx\\_meta\\_format](#) object contains two types of information: data object meta data and some specific information that defines how the valid region of an image changes

The meta data attributes that can be set are identified by this list:

- [vx\\_image](#) : [VX\\_IMAGE\\_FORMAT](#), [VX\\_IMAGE\\_HEIGHT](#), [VX\\_IMAGE\\_WIDTH](#) [R01322]
- [vx\\_array](#) : [VX\\_ARRAY\\_CAPACITY](#), [VX\\_ARRAY\\_ITEMTYPE](#) [R01323]
- [vx\\_pyramid](#) : [VX\\_PYRAMID\\_FORMAT](#), [VX\\_PYRAMID\\_HEIGHT](#), [VX\\_PYRAMID\\_WIDTH](#), [VX\\_PYRAMID\\_LEVELS](#), [VX\\_PYRAMID\\_SCALE](#) [R01324]
- [vx\\_scalar](#) : [VX\\_SCALAR\\_TYPE](#) [R01325]
- [vx\\_matrix](#) : [VX\\_MATRIX\\_TYPE](#), [VX\\_MATRIX\\_ROWS](#), [VX\\_MATRIX\\_COLUMNS](#) [R01326]
- [vx\\_distribution](#) : [VX\\_DISTRIBUTION\\_BINS](#), [VX\\_DISTRIBUTION\\_OFFSET](#), [VX\\_DISTRIBUTION\\_RANGE](#) [R01327]
- [vx\\_remap](#) : [VX\\_REMAP\\_SOURCE\\_WIDTH](#), [VX\\_REMAP\\_SOURCE\\_HEIGHT](#), [VX\\_REMAP\\_DESTINATION\\_WIDTH](#), [VX\\_REMAP\\_DESTINATION\\_HEIGHT](#) [R01328]
- [vx\\_lut](#) : [VX\\_LUT\\_TYPE](#), [VX\\_LUT\\_COUNT](#) [R01329]
- [vx\\_threshold](#) : [VX\\_THRESHOLD\\_TYPE](#), [VX\\_THRESHOLD\\_DATA\\_TYPE](#) [R01330]
- [vx\\_object\\_array](#) : [VX\\_OBJECT\\_ARRAY\\_NUMITEMS](#), [VX\\_OBJECT\\_ARRAY\\_ITEMTYPE](#) [R01331]
- [VX\\_VALID\\_RECT\\_CALLBACK](#) [R01332]

**Note**

For `vx_image`, a specific attribute can be used to specify the valid region evolution. This information is not a meta data.

**Parameters**

|    |                  |                                                                                                                                    |
|----|------------------|------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>meta</i>      | The reference to the <code>vx_meta_format</code> struct to set                                                                     |
| in | <i>attribute</i> | Use the subset of data object attributes that define the meta data of this object or attributes from <code>vx_meta_format</code> . |
| in | <i>ptr</i>       | The input pointer of the value to set on the meta format object.                                                                   |
| in | <i>size</i>      | The size in bytes of the object to which <i>ptr</i> points.                                                                        |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                                             |
|------------------------------------------|-----------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | The attribute was set; any other value indicates failure [ <i>R01333</i> ]. |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | meta is not a valid <code>vx_meta_format</code> reference.                  |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | size was not correct for the type needed.                                   |
| <code>VX_ERROR_NOT_SUPPORTED</code>      | the object attribute was not supported on the meta format object.           |
| <code>VX_ERROR_INVALID_TYPE</code>       | attribute type did not match known meta format type.                        |

**vxSetMetaFormatFromReference()**

```
vx_status VX_API_CALL vxSetMetaFormatFromReference (
 vx_meta_format meta,
 vx_reference exemplar)
```

Set a meta format object from an exemplar data object reference.

This function sets a `vx_meta_format` object from the meta data of the exemplar [*R01334*]

**Parameters**

|    |                 |                               |
|----|-----------------|-------------------------------|
| in | <i>meta</i>     | The meta format object to set |
| in | <i>exemplar</i> | The exemplar data object.     |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                         |                                                                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                 | The meta format was correctly set; any other value indicates failure [ <i>R01335</i> ].                                    |
| <code>VX_ERROR_INVALID_REFERENCE</code> | meta is not a valid <code>vx_meta_format</code> reference, or exemplar is not a valid <code>vx_reference</code> reference. |

## 3.78 Framework: Graph Parameters

### 3.78.1 Detailed Description

Defines the Graph Parameter API.

Graph parameters allow Clients to create graphs with Client settable parameters. Clients can then create Graph creation methods (a.k.a. *Graph Factories*). When creating these factories, the client will typically not be able to use the standard Node creator functions such as `vxSobel13x3Node` but instead will use the *manual* method via `vxCreateGenericNode`.

```
vx_graph vxCornersGraphFactory(vx_context context)
{
 vx_status status = VX_SUCCESS;
 vx_uint32 i;
 vx_float32 strength_thresh = 10000.0f;
 vx_float32 r = 1.5f;
 vx_float32 sensitivity = 0.14f;
 vx_int32 window_size = 3;
 vx_int32 block_size = 3;
 vx_enum channel = VX_CHANNEL_Y;
 vx_graph graph = vxCreateGraph(context);
 if (vxGetStatus((vx_reference)graph) == VX_SUCCESS)
 {
 vx_image virts[] = {
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
 vxCreateVirtualImage(graph, 0, 0,
 VX_DF_IMAGE_VIRT),
 };
 vx_kernel kernels[] = {
 vxGetKernelByEnum(context,
 VX_KERNEL_CHANNEL_EXTRACT),
 vxGetKernelByEnum(context, VX_KERNEL_MEDIAN_3x3),
 vxGetKernelByEnum(context, VX_KERNEL_HARRIS_CORNERS),
 };
 vx_node nodes[dimof(kernels)] = {
 vxCreateGenericNode(graph, kernels[0]),
 vxCreateGenericNode(graph, kernels[1]),
 vxCreateGenericNode(graph, kernels[2]),
 };
 vx_scalar scalars[] = {
 vxCreateScalar(context, VX_TYPE_ENUM, &channel),
 vxCreateScalar(context, VX_TYPE_FLOAT32, &strength_thresh),
 vxCreateScalar(context, VX_TYPE_FLOAT32, &r),
 vxCreateScalar(context, VX_TYPE_FLOAT32, &sensitivity),
 vxCreateScalar(context, VX_TYPE_INT32, &window_size),
 vxCreateScalar(context, VX_TYPE_INT32, &block_size),
 };
 vx_parameter parameters[] = {
 vxGetParameterByIndex(nodes[0], 0),
 vxGetParameterByIndex(nodes[2], 6)
 };
 // Channel Extract
 status |= vxAddParameterToGraph(graph, parameters[0]);
 status |= vxSetParameterByIndex(nodes[0], 1, (
 vx_reference)scalars[0]);
 status |= vxSetParameterByIndex(nodes[0], 2, (
 vx_reference)virts[0]);
 // Median Filter
 status |= vxSetParameterByIndex(nodes[1], 0, (
 vx_reference)virts[0]);
 status |= vxSetParameterByIndex(nodes[1], 1, (
 vx_reference)virts[1]);
 // Harris Corners
 status |= vxSetParameterByIndex(nodes[2], 0, (
 vx_reference)virts[1]);
 status |= vxSetParameterByIndex(nodes[2], 1, (
 vx_reference)scalars[1]);
 status |= vxSetParameterByIndex(nodes[2], 2, (
 vx_reference)scalars[2]);
 status |= vxSetParameterByIndex(nodes[2], 3, (
 vx_reference)scalars[3]);
 status |= vxSetParameterByIndex(nodes[2], 4, (
 vx_reference)scalars[4]);
 status |= vxSetParameterByIndex(nodes[2], 5, (
 vx_reference)scalars[5]);
 status |= vxAddParameterToGraph(graph, parameters[1]);

 for (i = 0; i < dimof(scalars); i++)
 {
 vxReleaseScalar(&scalars[i]);
 }
 for (i = 0; i < dimof(virts); i++)
```

```

 {
 vxReleaseImage(&virt[s[i]]);
 }
 for (i = 0; i < dimof(kernels); i++)
 {
 vxReleaseKernel(&kernels[i]);
 }
 for (i = 0; i < dimof(nodes); i++)
 {
 vxReleaseNode(&nodes[i]);
 }
 for (i = 0; i < dimof(parameters); i++)
 {
 vxReleaseParameter(¶meters[i]);
 }
}
return graph;
}

```

Some data are contained in these Graphs and do not become exposed to Clients of the factory. This allows ISVs or Vendors to create custom IP or IP-sensitive factories that Clients can use but may not be able to determine what is inside the factory. As the graph contains internal references to the data, the objects will not be freed until the graph itself is released.

## Functions

- **vx\_status VX\_API\_CALL vxAddParameterToGraph** (vx\_graph graph, vx\_parameter parameter)  
*Adds the given parameter extracted from a vx\_node to the graph.*
- **vx\_parameter VX\_API\_CALL vxGetGraphParameterByIndex** (vx\_graph graph, vx\_uint32 index)  
*Retrieves a vx\_parameter from a vx\_graph.*
- **vx\_status VX\_API\_CALL vxSetGraphParameterByIndex** (vx\_graph graph, vx\_uint32 index, vx\_reference value)  
*Sets a reference to the parameter on the graph. The implementation must set this parameter on the originating node as well [R00747].*

### 3.78.2 Function Documentation

#### vxAddParameterToGraph()

```

vx_status VX_API_CALL vxAddParameterToGraph (
 vx_graph graph,
 vx_parameter parameter)

```

Adds the given parameter extracted from a vx\_node to the graph.

#### Parameters

|    |           |                                                                     |
|----|-----------|---------------------------------------------------------------------|
| in | graph     | The graph reference that contains the node [R00743].                |
| in | parameter | The parameter reference to add to the graph from the node [R00744]. |

#### Returns

A The vx\_status Constants value.

#### Return values

|                             |                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------|
| VX_SUCCESS                  | Parameter added to Graph; any other value indicates failure [R00745].                       |
| VX_ERROR_INVALID_REFERENCE  | graph is not a valid vx_graph reference or parameter is not a valid vx_parameter reference. |
| VX_ERROR_INVALID_PARAMETERS | The parameter is of a node not in this graph [R00746].                                      |

**vxSetGraphParameterByIndex()**

```
vx_status VX_API_CALL vxSetGraphParameterByIndex (
 vx_graph graph,
 vx_uint32 index,
 vx_reference value)
```

Sets a reference to the parameter on the graph. The implementation must set this parameter on the originating node as well [R00747].

**Parameters**

|    |              |                                                 |
|----|--------------|-------------------------------------------------|
| in | <i>graph</i> | The graph reference [R00748].                   |
| in | <i>index</i> | The parameter index [R00749].                   |
| in | <i>value</i> | The reference to set to the parameter [R00750]. |

**Returns**

A The `vx_status Constants` value.

**Return values**

|                                          |                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>VX_SUCCESS</code>                  | Parameter set to Graph; any other value indicates failure [R00751].                                      |
| <code>VX_ERROR_INVALID_REFERENCE</code>  | graph is not a valid <code>vx_graph</code> reference or value is not a valid <code>vx_reference</code> . |
| <code>VX_ERROR_INVALID_PARAMETERS</code> | The parameter index is out of bounds or the dir parameter is incorrect [R00752].                         |

**vxGetGraphParameterByIndex()**

```
vx_parameter VX_API_CALL vxGetGraphParameterByIndex (
 vx_graph graph,
 vx_uint32 index)
```

Retrieves a `vx_parameter` from a `vx_graph`.

**Parameters**

|    |              |                                      |
|----|--------------|--------------------------------------|
| in | <i>graph</i> | The graph [R00753].                  |
| in | <i>index</i> | The index of the parameter [R00754]. |

**Returns**

`vx_parameter` reference [R00755]. Any possible errors preventing a successful function completion should be checked using `vxGetStatus` [R00756].

## 3.79 Macros and Constants

### 3.79.1 Detailed Description

Macros and constants not included in other sections.

Defines lists of kernels, vendors, types etc.

#### Modules

- [Context Attribute Constants](#)

*A list of context attributes.*

- [List of allowed directives](#)

*Values given to the `vxDirective` API to enable/disable platform optimizations and/or features. Directives are not optional and usually are vendor-specific, by defining a vendor range of directives and starting their enumeration from there.*

- [Reference Attribute Constants](#)

*The reference attributes list.*

- [The Kernel Attribute Constants](#)

*The kernel attributes list.*

- [VX\\_GRAPH\\_STATE Constants](#)

*The constants describing a graph's state.*

- [VX\\_GRAPH\\_ Attributes](#)

*The Attributes that may be queried for a graph.*

- [The VX\\_TYPE Constants](#)

*The list of defines for all known types in OpenVX.*

- [The vx\\_status Constants](#)

*The enumeration of all status codes.*

- [Different types of constants](#)

*The set of supported enumerations in OpenVX.*

- [The Conversion Policy Enumeration.](#)

- [Image Type Constants](#)

*Based on the `VX_DF_IMAGE` definition.*

- [The Target Enumeration Constants.](#)

- [Constants for image channels](#)

*The channel enumerations for channel extractions.*

- [Interpolation Constants](#)

*The image reconstruction filters supported by image resampling operations.*

- [Non-linear filter functions](#)

*An enumeration of non-linear filter functions.*

- [Matrix patterns](#)

*An enumeration of matrix patterns. See `vxCreateMatrixFromPattern`*

- [The Map/Unmap flag](#)

*The Map/Unmap operation enumeration.*

- [The Vendor ID list for OpenVX.](#)

*The Vendor ID of the Implementation. As new vendors submit their implementations, this enumeration will grow.*

## Macros

- `#define VX_API_CALL`  
*Defines calling convention for OpenVX API.*
- `#define VX_ATTRIBUTE_BASE(vendor, object) (VX_SHL(vendor, 20) | VX_SHL(object, 8))`  
*Defines the manner in which to combine the Vendor and Object IDs to get the base value of the enumeration.*
- `#define VX_ATTRIBUTE_ENUM(vendor, object, num) (vx_enum)(VX_ATTRIBUTE_BASE(vendor, object) + (uint32_t)(num))`  
*Create an attribute enumeration value from vendor, object and number.*
- `#define VX_ATTRIBUTE_ID_MASK (0x000000FF)`  
*An object's attribute ID is within the range of  $[0, 2^8 - 1]$  (inclusive).*
- `#define VX_CALLBACK`  
*Defines calling convention for user callbacks.*
- `#define VX_DF_IMAGE(a, b, c, d) (VX_SHL(a, 0) | VX_SHL(b, 8) | VX_SHL(c, 16) | VX_SHL(d, 24))`  
*Converts a set of four chars into a `uint32_t` container of a `VX_DF_IMAGE` code.*
- `#define VX_ENUM(vendor, id, num) (vx_enum)(VX_ENUM_BASE(vendor, id) + (uint32_t)(num))`  
*Create an enumeration value from vendor, id and number.*
- `#define VX_ENUM_BASE(vendor, id) (VX_SHL(vendor, 20) | VX_SHL(id, 12))`  
*Defines the manner in which to combine the Vendor and Object IDs to get the base value of the enumeration.*
- `#define VX_ENUM_KERNEL(vendor, lib, num) (vx_enum)(VX_KERNEL_BASE(vendor, lib) + (uint32_t)(num))`  
*Create an kernel enumeration value from vendor, id and kernel number.*
- `#define VX_ENUM_MASK (0x00000FFF)`  
*A generic enumeration list can have values between  $[0, 2^{12} - 1]$  (inclusive).*
- `#define VX_ENUM_TYPE(e) (((vx_uint32)(e) & VX_ENUM_TYPE_MASK) >> 12)`  
*A macro to extract the enum type from an enumerated value.*
- `#define VX_ENUM_TYPE_MASK (0x000FF000)`  
*A type of enumeration. The valid range is between  $[0, 2^8 - 1]$  (inclusive).*
- `#define VX_FMT_REF "%p"`  
*Use to aid in debugging values in OpenVX.*
- `#define VX_FMT_SIZE "%zu"`  
*Use to aid in debugging values in OpenVX.*
- `#define VX_KERNEL_BASE(vendor, lib) (VX_SHL(vendor, 20) | VX_SHL(lib, 12))`  
*Defines the manner in which to combine the Vendor and Library IDs to get the base value of the enumeration.*
- `#define VX_KERNEL_MASK (0x00000FFF)`  
*An individual kernel in a library has its own unique ID within  $[0, 2^{12} - 1]$  (inclusive).*
- `#define VX_LIBRARY(e) (((vx_uint32)(e) & VX_LIBRARY_MASK) >> 12)`  
*A macro to extract the kernel library enumeration from a enumerated kernel value.*
- `#define VX_LIBRARY_MASK (0x000FF000)`  
*A library is a set of vision kernels with its own ID supplied by a vendor. The vendor defines the library ID. The range is  $[0, 2^8 - 1]$  inclusive.*
- `#define VX_SCALE_UNITY (1024u)`  
*Use to indicate the 1:1 ratio in Q22.10 format.*
- `#define VX_SHL(A, B) (((uint32_t)(A)) << ((uint32_t)(B)))`  
*A rule to assist with MISRA checkers. This makes the RHS of shifts unsigned.*
- `#define VX_TYPE(e) (((vx_uint32)(e) & VX_TYPE_MASK) >> 8)`  
*A macro to extract the type from an enumerated attribute value.*
- `#define VX_TYPE_MASK (0x000FFF00)`  
*A type mask removes the scalar/object type from the attribute. It is 3 nibbles in size and is contained between the third and second byte.*
- `#define VX_VENDOR(e) (((vx_uint32)(e) & VX_VENDOR_MASK) >> 20)`  
*A macro to extract the vendor ID from the enumerated value.*
- `#define VX_VENDOR_MASK (0xFFF00000)`  
*Vendor IDs are 2 nibbles in size and are located in the upper byte of the 4 bytes of an enumeration.*

### 3.79.2 Macro Definition Documentation

#### VX\_TYPE\_MASK

```
#define VX_TYPE_MASK (0x000FFF00)
```

A type mask removes the scalar/object type from the attribute. It is 3 nibbles in size and is contained between the third and second byte.

See also

[The VX\\_TYPE Constants](#)

Definition at line 462 of file [vx\\_types.h](#).

#### VX\_DF\_IMAGE

```
#define VX_DF_IMAGE(
 a,
 b,
 c,
 d) (VX_SHL(a, 0) | VX_SHL(b, 8) | VX_SHL(c, 16) | VX_SHL(d, 24))
```

Converts a set of four chars into a `uint32_t` container of a `VX_DF_IMAGE` code.

Note

Use a [vx\\_df\\_image](#) variable to hold the value.

Definition at line 522 of file [vx\\_types.h](#).

#### VX\_ENUM\_BASE

```
#define VX_ENUM_BASE(
 vendor,
 id) (VX_SHL(vendor, 20) | VX_SHL(id, 12))
```

Defines the manner in which to combine the Vendor and Object IDs to get the base value of the enumeration.

From any enumerated value (with exceptions), the vendor, and enumeration type should be extractable. Those types that are exceptions are [The Vendor ID list for OpenVX.](#), [The VX\\_TYPE Constants](#), [Different types of constants](#), [Image Type Constants](#), and [vx\\_bool](#).

Definition at line 545 of file [vx\\_types.h](#).

## 3.80 Context Attribute Constants

### 3.80.1 Detailed Description

A list of context attributes.

#### Macros

- `#define VX_CONTEXT_CONVOLUTION_MAX_DIMENSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x8))`

*The maximum width or height of a convolution matrix [R01434]. Read-only [R01435]. Use a `vx_size` parameter. Each vendor must support centered kernels of size  $w \times h$ , where both  $w$  and  $h$  are odd numbers,  $3 \leq w \leq n$  and  $3 \leq h \leq n$ , where  $n$  is the value of the `VX_CONTEXT_CONVOLUTION_MAX_DIMENSION` attribute.  $n$  is an odd number that should not be smaller than 9.  $w$  and  $h$  may or may not be equal to each other. All combinations of  $w$  and  $h$  meeting the conditions above must be supported [R01436]. The behavior of `vxCreateConvolution` is undefined for values larger than the value returned by this attribute.*
- `#define VX_CONTEXT_EXTENSIONS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x7))`

*Retrieves the extensions string [R01432]. Read-only [R01433]. This is a space-separated string of extension names. Each OpenVX official extension has a unique identifier, comprised of capital letters, numbers and the underscore character, prefixed with "KHR\_", for example "KHR\_NEW\_FEATURE". Use a `vx_char` pointer allocated to the size returned from `VX_CONTEXT_EXTENSIONS_SIZE`.*
- `#define VX_CONTEXT_EXTENSIONS_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x6))`

*Queries the number of bytes in the extensions string [R01430]. Read-only [R01431]. Use a `vx_size` parameter.*
- `#define VX_CONTEXT_IMPLEMENTATION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x5))`

*Queries the context for its implementation name [R01428]. Read-only [R01429]. Use a `vx_char[VX_MAX_IMPLEMENTATION_NAME]` array.*
- `#define VX_CONTEXT_MODULES (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x3))`

*Queries the context for the number of active modules [R01424]. Read-only [R01425]. Use a `vx_uint32` parameter.*
- `#define VX_CONTEXT_NONLINEAR_MAX_DIMENSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0xd))`

*The dimension of the largest nonlinear filter supported [R01449]. See `vxNonLinearFilterNode`.*
- `#define VX_CONTEXT_OPTICAL_FLOW_MAX_WINDOW_DIMENSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x9))`

*The maximum window dimension of the OpticalFlowPyrLK kernel [R01437]. The value of this attribute shall be equal to or greater than '9' [R01438].*
- `#define VX_CONTEXT_REFERENCES (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x4))`

*Queries the context for the number of active references [R01426]. Read-only [R01427]. Use a `vx_uint32` parameter.*
- `#define VX_CONTEXT_UNIQUE_KERNEL_TABLE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0xB))`

*Returns the table of all unique the kernels that exist in the context [R01443]. Read-only [R01444]. Use a `vx_kernel_info_t` array.*
- `#define VX_CONTEXT_UNIQUE_KERNELS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x2))`

*Queries the context for the number of unique kernels [R01422]. Read-only [R01423]. Use a `vx_uint32` parameter.*
- `#define VX_CONTEXT_VENDOR_ID (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x0))`

*Queries the unique vendor ID [R01418]. Read-only [R01419]. Use a `vx_uint16`.*
- `#define VX_CONTEXT_VERSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x1))`

*Queries the OpenVX Version Number [R01420]. Read-only [R01421]. Use a `vx_uint16`.*

### 3.80.2 Macro Definition Documentation

#### VX\_CONTEXT\_OPTICAL\_FLOW\_MAX\_WINDOW\_DIMENSION

```
#define VX_CONTEXT_OPTICAL_FLOW_MAX_WINDOW_DIMENSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0x9))
```

The maximum window dimension of the OpticalFlowPyrLK kernel [R01437]. The value of this attribute shall be equal to or greater than '9' [R01438].

See also

[VX\\_KERNEL\\_OPTICAL\\_FLOW\\_PYR\\_LK](#). Read-only [R01439]. Use a [vx\\_size](#) parameter.

Definition at line 880 of file [vx\\_types.h](#).

#### VX\_CONTEXT\_UNIQUE\_KERNEL\_TABLE

```
#define VX_CONTEXT_UNIQUE_KERNEL_TABLE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0xB))
```

Returns the table of all unique the kernels that exist in the context [R01443]. Read-only [R01444]. Use a [vx\\_kernel\\_info\\_t](#) array.

Precondition

You must call [vxQueryContext](#) with [VX\\_CONTEXT\\_UNIQUE\\_KERNELS](#) to compute the necessary size of the array.

Definition at line 896 of file [vx\\_types.h](#).

#### VX\_CONTEXT\_NONLINEAR\_MAX\_DIMENSION

```
#define VX_CONTEXT_NONLINEAR_MAX_DIMENSION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONTEXT, 0xd))
```

The dimension of the largest nonlinear filter supported [R01449]. See [vxNonLinearFilterNode](#).

The implementation must support all dimensions (height or width, not necessarily the same) up to the value of this attribute [R01450]. The lowest value that must be supported for this attribute is 9 [R01451]. Read-only [R01452]. Use a [vx\\_size](#) parameter.

Definition at line 912 of file [vx\\_types.h](#).

## 3.81 List of allowed directives

### 3.81.1 Detailed Description

Values given to the `vxDirective` API to enable/disable platform optimizations and/or features. Directives are not optional and usually are vendor-specific, by defining a vendor range of directives and starting their enumeration from there.

See also

`vxDirective`

### Macros

- `#define VX_DIRECTIVE_DISABLE_LOGGING (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTIVE, 0x0))`  
*Disables recording information for graph debugging.*
- `#define VX_DIRECTIVE_DISABLE_PERFORMANCE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTIVE, 0x2))`  
*Disables performance counters for the context. By default performance counters are disabled.*
- `#define VX_DIRECTIVE_ENABLE_LOGGING (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTIVE, 0x1))`  
*Enables recording information for graph debugging.*
- `#define VX_DIRECTIVE_ENABLE_PERFORMANCE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTIVE, 0x3))`  
*Enables performance counters for the context.*

## 3.82 Reference Attribute Constants

### 3.82.1 Detailed Description

The reference attributes list.

#### Macros

- `#define VX_REFERENCE_COUNT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REFERENCE, 0x0))`  
*Returns the reference count of the object [R01412]. Read-only [R01413]. Use a `vx_uint32` parameter.*
- `#define VX_REFERENCE_NAME (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REFERENCE, 0x2))`  
*Used to query the reference for its name [R01416]. Read-write [R01417]. Use a pointer to `vx_char` parameter.*
- `#define VX_REFERENCE_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REFERENCE, 0x1))`  
*Returns the [The VX\\_TYPE Constants](#) of the reference [R01414]. Read-only [R01415]. Use a `vx_enum` parameter.*

## 3.83 The Kernel Attribute Constants

### 3.83.1 Detailed Description

The kernel attributes list.

#### Macros

- `#define VX_KERNEL_ENUM (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_KERNEL, 0x2))`  
Queries the enum of the kernel [R01457]. Not settable. Read-only [R01458]. Use a `vx_enum` parameter.
- `#define VX_KERNEL_LOCAL_DATA_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_KERNEL, 0x3))`  
The local data area allocated with each kernel when it becomes a node [R01459]. Read-write [R01460]. Can be written only before user-kernel finalization [R01461]. Use a `vx_size` parameter.
- `#define VX_KERNEL_NAME (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_KERNEL, 0x1))`  
Queries the name of the kernel [R01455]. Not settable. Read-only [R01456]. Use a `vx_char[VX_MAX_KERNEL_NAME]` array (not a `vx_array`).
- `#define VX_KERNEL_PARAMETERS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_KERNEL, 0x0))`  
Queries a kernel for the number of parameters the kernel supports [R01453]. Read-only [R01454]. Use a `vx_uint32` parameter.

### 3.83.2 Macro Definition Documentation

#### VX\_KERNEL\_LOCAL\_DATA\_SIZE

```
#define VX_KERNEL_LOCAL_DATA_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_KERNEL, 0x3))
```

The local data area allocated with each kernel when it becomes a node [R01459]. Read-write [R01460]. Can be written only before user-kernel finalization [R01461]. Use a `vx_size` parameter.

#### Note

If not set it will default to zero [R01462].

Definition at line 935 of file `vx_types.h`.

## 3.84 VX\_GRAPH\_STATE Constants

### 3.84.1 Detailed Description

The constants describing a graph's state.

#### Macros

- `#define VX_GRAPH_STATE_ABANDONED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_GRAPH_STATE, 0x3))`  
*The graph execution was abandoned.*
- `#define VX_GRAPH_STATE_COMPLETED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_GRAPH_STATE, 0x4))`  
*The graph execution is completed and the graph is not scheduled for execution.*
- `#define VX_GRAPH_STATE_RUNNING (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_GRAPH_STATE, 0x2))`  
*The graph either has been scheduled and not completed, or is being executed.*
- `#define VX_GRAPH_STATE_UNVERIFIED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_GRAPH_STATE, 0x0))`  
*The graph should be verified before execution.*
- `#define VX_GRAPH_STATE_VERIFIED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_GRAPH_STATE, 0x1))`  
*The graph has been verified and has not been executed or scheduled for execution yet.*

## 3.85 VX\_GRAPH\_ Attributes

### 3.85.1 Detailed Description

The Attributes that may be queried for a graph.

#### Macros

- `#define VX_GRAPH_NUMNODES (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_GRAPH, 0x0))`  
Returns the number of nodes in a graph. Read-only. Use a `vx_uint32` parameter.
- `#define VX_GRAPH_NUMPARAMETERS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_GRAPH, 0x3))`  
Returns the number of explicitly declared parameters on the graph. Read-only. Use a `vx_uint32` parameter.
- `#define VX_GRAPH_PERFORMANCE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_GRAPH, 0x2))`  
Returns the overall performance of the graph. Read-only. Use a `vx_perf_t` parameter. The accuracy of timing information is platform dependent.
- `#define VX_GRAPH_STATE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_GRAPH, 0x4))`  
Returns the state of the graph. See `VX_GRAPH_STATE Constants` enum.

### 3.85.2 Macro Definition Documentation

#### VX\_GRAPH\_PERFORMANCE

```
#define VX_GRAPH_PERFORMANCE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_GRAPH, 0x2))
```

Returns the overall performance of the graph. Read-only. Use a `vx_perf_t` parameter. The accuracy of timing information is platform dependent.

#### Note

Performance tracking must have been enabled. See [List of allowed directives](#)

Definition at line 702 of file `vx_types.h`.

## 3.86 The VX\_TYPE Constants

### 3.86.1 Detailed Description

The list of defines for all known types in OpenVX.

#### Macros

- `#define VX_TYPE_ARRAY 0x80E`  
A *vx\_array*.
- `#define VX_TYPE_BOOL 0x010`  
A *vx\_bool*.
- `#define VX_TYPE_CHAR 0x001`  
A *vx\_char*.
- `#define VX_TYPE_CONTEXT 0x801`  
A *vx\_context*.
- `#define VX_TYPE_CONVOLUTION 0x80C`  
A *vx\_convolution*.
- `#define VX_TYPE_COORDINATES2D 0x022`  
A *vx\_coordinates2d\_t*.
- `#define VX_TYPE_COORDINATES3D 0x023`  
A *vx\_coordinates3d\_t*.
- `#define VX_TYPE_DELAY 0x806`  
A *vx\_delay*.
- `#define VX_TYPE_DF_IMAGE 0x00E`  
A *vx\_df\_image*.
- `#define VX_TYPE_DISTRIBUTION 0x808`  
A *vx\_distribution*.
- `#define VX_TYPE_ENUM 0x00C`  
A *vx\_enum*. Equivalent in size to a *vx\_int32*.
- `#define VX_TYPE_ERROR 0x811`  
An error object which has no type.
- `#define VX_TYPE_FLOAT32 0x00A`  
A *vx\_float32*.
- `#define VX_TYPE_FLOAT64 0x00B`  
A *vx\_float64*.
- `#define VX_TYPE_GRAPH 0x802`  
A *vx\_graph*.
- `#define VX_TYPE_IMAGE 0x80F`  
A *vx\_image*.
- `#define VX_TYPE_INT16 0x004`  
A *vx\_int16*.
- `#define VX_TYPE_INT32 0x006`  
A *vx\_int32*.
- `#define VX_TYPE_INT64 0x008`  
A *vx\_int64*.
- `#define VX_TYPE_INT8 0x002`  
A *vx\_int8*.
- `#define VX_TYPE_INVALID 0x000`  
An invalid type value. When passed an error must be returned.
- `#define VX_TYPE_KERNEL 0x804`  
A *vx\_kernel*.

- `#define VX_TYPE_KEYPOINT 0x021`  
A *vx\_keypoint\_t*.
- `#define VX_TYPE_KHRONOS_OBJECT_END VX_TYPE_VENDOR_OBJECT_START - 1`  
A value for comparison between Khronos defined objects and vendor structs.
- `#define VX_TYPE_KHRONOS_OBJECT_START 0x800`  
A Khronos defined object base index.
- `#define VX_TYPE_KHRONOS_STRUCT_MAX VX_TYPE_USER_STRUCT_START - 1`  
A value for comparison between Khronos defined structs and user structs.
- `#define VX_TYPE_LUT 0x807`  
A *vx\_lut*.
- `#define VX_TYPE_MATRIX 0x80B`  
A *vx\_matrix*.
- `#define VX_TYPE_META_FORMAT 0x812`  
A *vx\_meta\_format*.
- `#define VX_TYPE_NODE 0x803`  
A *vx\_node*.
- `#define VX_TYPE_OBJECT_ARRAY 0x813`  
A *vx\_object\_array*.
- `#define VX_TYPE_PARAMETER 0x805`  
A *vx\_parameter*.
- `#define VX_TYPE_PYRAMID 0x809`  
A *vx\_pyramid*.
- `#define VX_TYPE_RECTANGLE 0x020`  
A *vx\_rectangle\_t*.
- `#define VX_TYPE_REFERENCE 0x800`  
A *vx\_reference*.
- `#define VX_TYPE_REMAP 0x810`  
A *vx\_remap*.
- `#define VX_TYPE_SCALAR 0x80D`  
A *vx\_scalar*. when needed to be completely generic for kernel validation.
- `#define VX_TYPE_SCALAR_MAX (VX_TYPE_BOOL+1)`  
A floating value for comparison between OpenVX scalars and OpenVX structs.
- `#define VX_TYPE_SIZE 0x00D`  
A *vx\_size*.
- `#define VX_TYPE_THRESHOLD 0x80A`  
A *vx\_threshold*.
- `#define VX_TYPE_UINT16 0x005`  
A *vx\_uint16*.
- `#define VX_TYPE_UINT32 0x007`  
A *vx\_uint32*.
- `#define VX_TYPE_UINT64 0x009`  
A *vx\_uint64*.
- `#define VX_TYPE_UINT8 0x003`  
A *vx\_uint8*.
- `#define VX_TYPE_USER_STRUCT_END VX_TYPE_VENDOR_STRUCT_START - 1`  
A value for comparison between user structs and vendor structs.
- `#define VX_TYPE_USER_STRUCT_START 0x100`  
A user-defined struct base index.
- `#define VX_TYPE_VENDOR_OBJECT_END 0xFFFF`  
A value used for bound checking of vendor objects.
- `#define VX_TYPE_VENDOR_OBJECT_START 0xC00`

- A vendor defined object base index.*
- `#define VX_TYPE_VENDOR_STRUCT_END VX_TYPE_KHRONOS_OBJECT_START - 1`  
*A value for comparison between vendor structs and Khronos defined objects.*
- `#define VX_TYPE_VENDOR_STRUCT_START 0x400`  
*A vendor-defined struct base index.*

## 3.87 The vx\_status Constants

### 3.87.1 Detailed Description

The enumeration of all status codes.

See also

[vx\\_status](#).

### Macros

- #define [VX\\_ERROR\\_GRAPH\\_ABANDONED](#) -22  
*Indicates that the graph is stopped due to an error or a callback that abandoned execution.*
- #define [VX\\_ERROR\\_GRAPH\\_SCHEDULED](#) -21  
*Indicates that the supplied graph already has been scheduled and may be currently executing.*
- #define [VX\\_ERROR\\_INVALID\\_DIMENSION](#) -15  
*Indicates that the supplied parameter is too big or too small in dimension.*
- #define [VX\\_ERROR\\_INVALID\\_FORMAT](#) -14  
*Indicates that the supplied parameter is in an invalid format.*
- #define [VX\\_ERROR\\_INVALID\\_GRAPH](#) -18  
*Indicates that the supplied graph has invalid connections (cycles).*
- #define [VX\\_ERROR\\_INVALID\\_LINK](#) -13  
*Indicates that the link is not possible as specified. The parameters are incompatible.*
- #define [VX\\_ERROR\\_INVALID\\_MODULE](#) -11  
*This is returned from [vxLoadKernels](#) when the module does not contain the entry point.*
- #define [VX\\_ERROR\\_INVALID\\_NODE](#) -19  
*Indicates that the supplied node could not be created.*
- #define [VX\\_ERROR\\_INVALID\\_PARAMETERS](#) -10  
*Indicates that the supplied parameter information does not match the kernel contract.*
- #define [VX\\_ERROR\\_INVALID\\_REFERENCE](#) -12  
*Indicates that the reference provided is not valid.*
- #define [VX\\_ERROR\\_INVALID\\_SCOPE](#) -20  
*Indicates that the supplied parameter is from another scope and cannot be used in the current scope.*
- #define [VX\\_ERROR\\_INVALID\\_TYPE](#) -17  
*Indicates that the supplied type parameter is incorrect.*
- #define [VX\\_ERROR\\_INVALID\\_VALUE](#) -16  
*Indicates that the supplied parameter has an incorrect value.*
- #define [VX\\_ERROR\\_MULTIPLE\\_WRITERS](#) -23  
*Indicates that the graph has more than one node outputting to the same data object. This is an invalid graph structure.*
- #define [VX\\_ERROR\\_NO\\_MEMORY](#) -8  
*Indicates that an internal or implicit allocation failed. Typically catastrophic. After detection, deconstruct the context.*
- #define [VX\\_ERROR\\_NO\\_RESOURCES](#) -7  
*Indicates that an internal or implicit resource can not be acquired (not memory). This is typically catastrophic. After detection, deconstruct the context.*
- #define [VX\\_ERROR\\_NOT\\_ALLOCATED](#) -5  
*Indicates to the system that the parameter must be allocated by the system.*
- #define [VX\\_ERROR\\_NOT\\_COMPATIBLE](#) -6  
*Indicates that the attempt to link two parameters together failed due to type incompatibility.*
- #define [VX\\_ERROR\\_NOT\\_IMPLEMENTED](#) -2  
*Indicates that the requested kernel is missing.*
- #define [VX\\_ERROR\\_NOT\\_SUFFICIENT](#) -4  
*Indicates that the given graph has failed verification due to an insufficient number of required parameters, which cannot be automatically created. Typically this indicates required atomic parameters.*

- `#define VX_ERROR_NOT_SUPPORTED -3`  
*Indicates that the requested set of parameters produce a configuration that cannot be supported. Refer to the supplied documentation on the configured kernels.*
- `#define VX_ERROR_OPTIMIZED_AWAY -9`  
*Indicates that the object referred to has been optimized out of existence.*
- `#define VX_ERROR_REFERENCE_NONZERO -24`  
*Indicates that an operation did not complete due to a reference count being non-zero.*
- `#define VX_FAILURE -1`  
*Indicates a generic error code, used when no other describes the error.*
- `#define VX_STATUS_MIN -25`  
*Indicates the lower bound of status codes in VX. Used for bounds checks only.*
- `#define VX_SUCCESS 0`  
*No error.*

### 3.87.2 Macro Definition Documentation

#### VX\_ERROR\_NO\_MEMORY

```
#define VX_ERROR_NO_MEMORY -8
```

Indicates that an internal or implicit allocation failed. Typically catastrophic. After detection, deconstruct the context.

See also

[vxVerifyGraph](#).

Definition at line 418 of file [vx\\_types.h](#).

#### VX\_ERROR\_NO\_RESOURCES

```
#define VX_ERROR_NO_RESOURCES -7
```

Indicates that an internal or implicit resource can not be acquired (not memory). This is typically catastrophic. After detection, deconstruct the context.

See also

[vxVerifyGraph](#).

Definition at line 419 of file [vx\\_types.h](#).

#### VX\_ERROR\_NOT\_SUFFICIENT

```
#define VX_ERROR_NOT_SUFFICIENT -4
```

Indicates that the given graph has failed verification due to an insufficient number of required parameters, which cannot be automatically created. Typically this indicates required atomic parameters.

See also

[vxVerifyGraph](#).

Definition at line 422 of file [vx\\_types.h](#).

**VX\_ERROR\_NOT\_SUPPORTED**

```
#define VX_ERROR_NOT_SUPPORTED -3
```

Indicates that the requested set of parameters produce a configuration that cannot be supported. Refer to the supplied documentation on the configured kernels.

See also

[The list of available kernels](#). This is also returned if a function to set an attribute is called on a Read-only attribute.

Definition at line [423](#) of file [vx\\_types.h](#).

**VX\_ERROR\_NOT\_IMPLEMENTED**

```
#define VX_ERROR_NOT_IMPLEMENTED -2
```

Indicates that the requested kernel is missing.

See also

[The list of available kernels vxGetKernelByName](#).

Definition at line [424](#) of file [vx\\_types.h](#).

## 3.88 Different types of constants

### 3.88.1 Detailed Description

The set of supported enumerations in OpenVX.

These can be extracted from enumerated values using `VX_ENUM_TYPE`.

#### Macros

- `#define VX_ENUM_ACCESSOR 0x11`  
*An accessor flag type.*
- `#define VX_ENUM_ACTION 0x01`  
*Action Codes.*
- `#define VX_ENUM_BORDER 0x0C`  
*Border Mode List.*
- `#define VX_ENUM_BORDER_POLICY 0x14`  
*Unsupported Border Mode Policy List.*
- `#define VX_ENUM_CHANNEL 0x09`  
*Channel Name.*
- `#define VX_ENUM_COLOR_RANGE 0x07`  
*Color Space Range.*
- `#define VX_ENUM_COLOR_SPACE 0x06`  
*Color Space.*
- `#define VX_ENUM_COMPARISON 0x0D`  
*Comparison Values.*
- `#define VX_ENUM_CONVERT_POLICY 0x0A`  
*Convert Policy.*
- `#define VX_ENUM_DIRECTION 0x00`  
*Parameter Direction.*
- `#define VX_ENUM_DIRECTIVE 0x03`  
*Directive Values.*
- `#define VX_ENUM_GRAPH_STATE 0x15`  
*Graph attribute states.*
- `#define VX_ENUM_HINT 0x02`  
*Hint Values.*
- `#define VX_ENUM_INTERPOLATION 0x04`  
*Interpolation Types.*
- `#define VX_ENUM_IX_USE 0x18`  
*An enumeration of export uses. See [vxExportObjectsToMemory](#) and [vxImportObjectsFromMemory](#)*
- `#define VX_ENUM_MEMORY_TYPE 0x0E`  
*The memory type enumeration.*
- `#define VX_ENUM_NONLINEAR 0x16`  
*Non-linear function list.*
- `#define VX_ENUM_NORM_TYPE 0x10`  
*A norm type.*
- `#define VX_ENUM_OVERFLOW 0x05`  
*Overflow Policies.*
- `#define VX_ENUM_PARAMETER_STATE 0x08`  
*Parameter State.*
- `#define VX_ENUM_PATTERN 0x17`  
*Matrix pattern enumeration.*
- `#define VX_ENUM_ROUND_POLICY 0x12`

*Rounding Policy.*

- #define `VX_ENUM_TARGET` 0x13

*Target.*

- #define `VX_ENUM_TERM_CRITERIA` 0x0F

*A termination criteria.*

- #define `VX_ENUM_THRESHOLD_TYPE` 0x0B

*Threshold Type List.*

## 3.89 Return code action values

### 3.89.1 Detailed Description

Possible return values from a `vx_nodecomplete_f` during execution.

See also

`vxAssignNodeCallback`

### Macros

- `#define VX_ACTION_ABANDON (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ACTION, 0x1))`  
*Stop executing the graph.*
- `#define VX_ACTION_CONTINUE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ACTION, 0x0))`  
*Continue executing the graph with no changes.*

## 3.90 Parameter direction enumeration

### 3.90.1 Detailed Description

An indication of how a kernel will treat the given parameter.

#### Macros

- `#define VX_BIDIRECTIONAL (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTION, 0x2))`  
*The parameter is both an input and output.*
- `#define VX_INPUT (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTION, 0x0))`  
*The parameter is an input only.*
- `#define VX_OUTPUT (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_DIRECTION, 0x1))`  
*The parameter is an output only.*

## 3.91 VX\_HINT Values

### 3.91.1 Detailed Description

Values provided to the `vxHint` API to enable/disable platform optimizations and/or features. Hints are optional and usually are vendor-specific.

See also

`vxHint`

### Macros

- `#define VX_HINT_PERFORMANCE_DEFAULT (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_HINT, 0x1))`  
*Indicates to the implementation that user do not apply any specific requirements for performance.*
- `#define VX_HINT_PERFORMANCE_HIGH_SPEED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_HINT, 0x3))`  
*Indicates the user preference for highest performance over low power consumption.*
- `#define VX_HINT_PERFORMANCE_LOW_POWER (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_HINT, 0x2))`  
*Indicates the user preference is low power consumption versus highest performance.*

## 3.92 The Conversion Policy Enumeration.

### 3.92.1 Detailed Description

#### Macros

- `#define VX_CONVERT_POLICY_SATURATE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CONVERT_POLICY, 0x1))`  
*Results are saturated to the bit depth of the output operand.*
- `#define VX_CONVERT_POLICY_WRAP (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CONVERT_POLICY, 0x0))`  
*Results are the least significant bits of the output operand, as if stored in two's complement binary format in the size of its bit-depth.*

## 3.93 Image Type Constants

### 3.93.1 Detailed Description

Based on the `VX_DF_IMAGE` definition.

Note

Use `vx_df_image` to contain these values.

#### Macros

- `#define VX_DF_IMAGE_IYUV (VX_DF_IMAGE('I','Y','U','V'))`  
A 3 plane of 8-bit 4:2:0 sampled Y, U, V planes. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_NV12 (VX_DF_IMAGE('N','V','1','2'))`  
A 2-plane YUV format of Luma (Y) and interleaved UV data at 4:2:0 sampling. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_NV21 (VX_DF_IMAGE('N','V','2','1'))`  
A 2-plane YUV format of Luma (Y) and interleaved VU data at 4:2:0 sampling. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_RGB (VX_DF_IMAGE('R','G','B','2'))`  
A single plane of 24-bit pixel as 3 interleaved 8-bit units of R then G then B data. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_RGBX (VX_DF_IMAGE('R','G','B','A'))`  
A single plane of 32-bit pixel as 4 interleaved 8-bit units of R then G then B data, then a don't care byte. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_S16 (VX_DF_IMAGE('S','0','1','6'))`  
A single plane of signed 16-bit data. The range of data is not specified, as it may be extracted from a YUV or generated.
- `#define VX_DF_IMAGE_S32 (VX_DF_IMAGE('S','0','3','2'))`  
A single plane of unsigned 32-bit data. The range of data is not specified, as it may be extracted from a YUV or generated.
- `#define VX_DF_IMAGE_U16 (VX_DF_IMAGE('U','0','1','6'))`  
A single plane of unsigned 16-bit data. The range of data is not specified, as it may be extracted from a YUV or generated.
- `#define VX_DF_IMAGE_U32 (VX_DF_IMAGE('U','0','3','2'))`  
A single plane of unsigned 32-bit data. The range of data is not specified, as it may be extracted from a YUV or generated.
- `#define VX_DF_IMAGE_U8 (VX_DF_IMAGE('U','0','0','8'))`  
A single plane of unsigned 8-bit data. The range of data is not specified, as it may be extracted from a YUV or generated.
- `#define VX_DF_IMAGE_UYVY (VX_DF_IMAGE('U','Y','V','Y'))`  
A single plane of 32-bit macro pixel of U0, Y0, V0, Y1 bytes. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_VIRT (VX_DF_IMAGE('V','I','R','T'))`  
A virtual image of no defined type.
- `#define VX_DF_IMAGE_YUV4 (VX_DF_IMAGE('Y','U','V','4'))`  
A 3 plane of 8 bit 4:4:4 sampled Y, U, V planes. This uses the BT709 full range by default.
- `#define VX_DF_IMAGE_YUYV (VX_DF_IMAGE('Y','U','Y','V'))`  
A single plane of 32-bit macro pixel of Y0, U0, Y1, V0 bytes. This uses the BT709 full range by default.

## 3.94 The Target Enumeration Constants.

### 3.94.1 Detailed Description

#### Macros

- #define `VX_TARGET_ANY` (`VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TARGET, 0x0000)`)  
*Any available target. An OpenVX implementation must support at least one target associated with this value.*
- #define `VX_TARGET_STRING` (`VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TARGET, 0x0001)`)  
*Target, explicitly specified by its (case-insensitive) name string.*
- #define `VX_TARGET_VENDOR_BEGIN` (`VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TARGET, 0x1000)`)  
*Start of Vendor specific target enumerates.*

## 3.95 The Node Attribute Constants

### 3.95.1 Detailed Description

The node attributes list.

#### Macros

- `#define VX_NODE_BORDER (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x2))`  
*Gets or sets the border mode of the node [R01468]. Read-write [R01469]. Use a `vx_border_t` structure with a default value of `VX_BORDER_UNDEFINED`.*
- `#define VX_NODE_IS_REPLICATED (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x6))`  
*Indicates whether the node is replicated [R01478]. Read-only [R01479]. Use a `vx_bool` parameter.*
- `#define VX_NODE_LOCAL_DATA_PTR (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x4))`  
*Indicates the pointer kernel local memory area [R01473]. Read-Write [R01474]. Can be written only at user-node (de)initialization if `VX_KERNEL_LOCAL_DATA_SIZE==0` [R01475]. Use a `void *` parameter.*
- `#define VX_NODE_LOCAL_DATA_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x3))`  
*Indicates the size of the kernel local memory area [R01470]. Read-write [R01471]. Can be written only at user-node (de)initialization if `VX_KERNEL_LOCAL_DATA_SIZE==0` [R01472]. Use a `vx_size` parameter.*
- `#define VX_NODE_PARAMETERS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x5))`  
*Indicates the number of node parameters, including optional parameters that are not passed [R01476]. Read-only [R01477]. Use a `vx_uint32` parameter.*
- `#define VX_NODE_PERFORMANCE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x1))`  
*Queries the performance of the node execution [R01465]. The accuracy of timing information is platform dependent and also depends on the graph optimizations. Read-only [R01466].*
- `#define VX_NODE_REPLICATE_FLAGS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x7))`  
*Indicates the replicated parameters [R01480]. Read-only [R01481]. Use a `vx_bool*` parameter.*
- `#define VX_NODE_STATUS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x0))`  
*Queries the status of node execution [R01463]. Read-only [R01464]. Use a `vx_status` parameter.*
- `#define VX_NODE_VALID_RECT_RESET (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x8))`  
*Indicates the behavior with respect to the valid rectangle [R01482]. Read-only [R01483]. Use a `vx_bool` parameter.*

### 3.95.2 Macro Definition Documentation

#### VX\_NODE\_PERFORMANCE

```
#define VX_NODE_PERFORMANCE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_NODE, 0x1))
```

Queries the performance of the node execution [R01465]. The accuracy of timing information is platform dependent and also depends on the graph optimizations. Read-only [R01466].

#### Note

Performance tracking must have been enabled [R01467]. See [List of allowed directives](#).

Definition at line 951 of file `vx_types.h`.

## 3.96 The Parameter Attributes Constants

### 3.96.1 Detailed Description

The parameter attributes list.

#### Macros

- `#define VX_PARAMETER_DIRECTION (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PARAMETER, 0x1))`  
*Queries a parameter for its direction value on the kernel with which it is associated [R01486]. Read-only [R01487]. Use a `vx_enum` parameter.*
- `#define VX_PARAMETER_INDEX (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PARAMETER, 0x0))`  
*Queries a parameter for its index value on the kernel with which it is associated [R01484]. Read-only [R01485]. Use a `vx_uint32` parameter.*
- `#define VX_PARAMETER_REF (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PARAMETER, 0x4))`  
*Use to extract the reference contained in the parameter [R01492]. Read-only [R01493]. Use a `vx_reference` parameter.*
- `#define VX_PARAMETER_STATE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PARAMETER, 0x3))`  
*Queries a parameter for its state. A value in *The parameter state type constants.* is returned [R01490]. Read-only [R01491]. Use a `vx_enum` parameter.*
- `#define VX_PARAMETER_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PARAMETER, 0x2))`  
*Queries a parameter for its type, *The VX\_TYPE Constants* is returned [R01488]. Read-only [R01489]. The size of the parameter is implied for plain data objects. For opaque data objects like images and arrays a query to their attributes has to be called to determine the size.*

## 3.97 The Image Attributes Constants

### 3.97.1 Detailed Description

The image attributes list.

#### Macros

- `#define VX_IMAGE_FORMAT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x2))`  
*Queries an image for its format [R01498]. Read-only [R01499]. Use a `vx_df_image` parameter.*
- `#define VX_IMAGE_HEIGHT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x1))`  
*Queries an image for its height [R01496]. Read-only [R01497]. Use a `vx_uint32` parameter.*
- `#define VX_IMAGE_MEMORY_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x7))`  
*Queries memory type if created using `vxCreateImageFromHandle` [R01508]. If `vx_image` was not created using `vxCreateImageFromHandle`, `VX_MEMORY_TYPE_NONE` is returned [R01509].*
- `#define VX_IMAGE_PLANES (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x3))`  
*Queries an image for its number of planes [R01500]. Read-only [R01501]. Use a `vx_size` parameter.*
- `#define VX_IMAGE_RANGE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x5))`  
*Queries an image for its channel range (see [Image Channel Range Constants](#)) [R01504]. Read-only [R01505]. Use a `vx_enum` parameter.*
- `#define VX_IMAGE_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x6))`  
*Queries an image for its total number of bytes [R01506]. Read-only [R01507]. Use a `vx_size` parameter.*
- `#define VX_IMAGE_SPACE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x4))`  
*Queries an image for its color space (see [Image Color Space Constants](#)) [R01502]. Read-write [R01503]. Use a `vx_enum` parameter.*
- `#define VX_IMAGE_WIDTH (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_IMAGE, 0x0))`  
*Queries an image for its width [R01494]. Read-only [R01495]. Use a `vx_uint32` parameter.*

## 3.98 The Scalar Attributes Constants

### 3.98.1 Detailed Description

The scalar attributes list.

#### Macros

- `#define VX\_SCALAR\_TYPE (VX\_ATTRIBUTE\_ENUM(VX\_ID\_KHRONOS, VX\_TYPE\_SCALAR, 0x0))`  
*Queries the type of atomic that is contained in the scalar [R01510]. Read-only [R01511]. Use a [vx\\_enum](#) parameter.*

## 3.99 The Look-Up Table (LUT) attribute list.

### 3.99.1 Detailed Description

The Look-Up Table (LUT) attribute list.

#### Macros

- `#define VX_LUT_COUNT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS,VX_TYPE_LUT, 0x1))`  
*Indicates the number of elements in the LUT [R01514]. Read-only [R01515]. Use a `vx_size`.*
- `#define VX_LUT_OFFSET (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS,VX_TYPE_LUT, 0x3))`  
*Indicates the index of the input value = 0 [R01518]. Read-only [R01519]. Uses a `vx_uint32`.*
- `#define VX_LUT_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS,VX_TYPE_LUT, 0x2))`  
*Indicates the total size of the LUT in bytes [R01516]. Read-only [R01517]. Uses a `vx_size`.*
- `#define VX_LUT_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS,VX_TYPE_LUT, 0x0))`  
*Indicates the value type of the LUT [R01512]. Read-only [R01513]. Use a `vx_enum`.*

## 3.100 The distribution attribute list.

### 3.100.1 Detailed Description

#### Macros

- `#define VX_DISTRIBUTION_BINS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x3))`  
*Indicates the number of bins [R01525]. Read-only [R01526]. Use a `vx_size` parameter.*
- `#define VX_DISTRIBUTION_DIMENSIONS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x0))`  
*Indicates the number of dimensions in the distribution [R01520]. Read-only [R01521]. Use a `vx_size` parameter.*
- `#define VX_DISTRIBUTION_OFFSET (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x1))`  
*Indicates the start of the values to use (inclusive) [R01522]. Read-only [R01523]. Use a `vx_int32` parameter.*
- `#define VX_DISTRIBUTION_RANGE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x2))`  
*Indicates the total number of the consecutive values of the distribution interval [R01524].*
- `#define VX_DISTRIBUTION_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x5))`  
*Indicates the total size of the distribution in bytes [R01531]. Read-only [R01532]. Use a `vx_size` parameter.*
- `#define VX_DISTRIBUTION_WINDOW (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DISTRIBUTION, 0x4))`  
*Indicates the width of a bin [R01527]. Equal to the range divided by the number of bins [R01528]. If the range is not a multiple of the number of bins, it is not valid [R01529]. Read-only [R01530]. Use a `vx_uint32` parameter.*

## 3.101 The Threshold types.

### 3.101.1 Detailed Description

The Threshold types.

#### Macros

- `#define VX_THRESHOLD_TYPE_BINARY (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_THRESHOLD_T↵  
YPE, 0x0))`  
*A threshold with only 1 value.*
- `#define VX_THRESHOLD_TYPE_RANGE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_THRESHOLD_T↵  
YPE, 0x1))`  
*A threshold with 2 values (upper/lower). Use with Canny Edge Detection.*

## 3.102 The threshold attributes.

### 3.102.1 Detailed Description

The threshold attributes.

#### Macros

- `#define VX_THRESHOLD_DATA_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x6))`  
*The data type of the threshold's value [R01545]. Read-only [R01546]. Use a `vx_enum` parameter. Will contain a *The VX\_TYPE Constants*.*
- `#define VX_THRESHOLD_FALSE_VALUE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x5))`  
*The value of the FALSE threshold (default value is 0) [R01543]. Read-write [R01544]. Use a `vx_int32` parameter.*
- `#define VX_THRESHOLD_THRESHOLD_LOWER (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x2))`  
*The value of the lower threshold [R01537]. Read-write [R01538]. Use a `vx_int32` parameter.*
- `#define VX_THRESHOLD_THRESHOLD_UPPER (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x3))`  
*The value of the higher threshold [R01539]. Read-write [R01540]. Use a `vx_int32` parameter.*
- `#define VX_THRESHOLD_THRESHOLD_VALUE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x1))`  
*The value of the single threshold [R01535]. Read-write [R01536]. Use a `vx_int32` parameter.*
- `#define VX_THRESHOLD_TRUE_VALUE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x4))`  
*The value of the TRUE threshold (default value is 255) [R01541]. Read-write [R01542]. Use a `vx_int32` parameter.*
- `#define VX_THRESHOLD_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_THRESHOLD, 0x0))`  
*The value type of the threshold [R01533]. Read-only [R01534]. Use a `vx_enum` parameter. Will contain a *The Threshold types*..*

### 3.103 The matrix attributes.

#### 3.103.1 Detailed Description

The matrix attributes.

#### Macros

- `#define VX_MATRIX_COLUMNS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x2))`  
*The N dimension of the matrix [R01551]. Read-only [R01552]. Use a [vx\\_size](#) parameter.*
- `#define VX_MATRIX_ORIGIN (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x4))`  
*The origin of the matrix with a default value of [floor(VX\_MATRIX\_COLUMNS/2), floor(VX\_MATRIX\_ROWS/2)] [R01555]. Read-only [R01556]. Use a [vx\\_coordinates2d\\_t](#) parameter.*
- `#define VX_MATRIX_PATTERN (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x5))`  
*The pattern of the matrix [R01557]. See [Matrix patterns](#) . Read-only [R01558]. Use a [vx\\_enum](#) parameter.*
- `#define VX_MATRIX_ROWS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x1))`  
*The M dimension of the matrix [R01549]. Read-only [R01550]. Use a [vx\\_size](#) parameter.*
- `#define VX_MATRIX_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x3))`  
*The total size of the matrix in bytes [R01553]. Read-only [R01554]. Use a [vx\\_size](#) parameter.*
- `#define VX_MATRIX_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_MATRIX, 0x0))`  
*The value type of the matrix [R01547]. Read-only [R01548]. Use a [vx\\_enum](#) parameter.*

## 3.104 The convolution attributes.

### 3.104.1 Detailed Description

The convolution attributes.

#### Macros

- `#define VX_CONVOLUTION_COLUMNS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONVOLUTION, 0x1))`  
*The number of columns of the convolution matrix. Read-only [R01561]. Use a `vx_size` parameter [R01562].*
- `#define VX_CONVOLUTION_ROWS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONVOLUTION, 0x0))`  
*The number of rows of the convolution matrix. Read-only [R01559]. Use a `vx_size` parameter [R01560].*
- `#define VX_CONVOLUTION_SCALE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONVOLUTION, 0x2))`  
*The scale of the convolution matrix. Read-write [R01563]. Use a `vx_uint32` parameter [R01564].*
- `#define VX_CONVOLUTION_SIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_CONVOLUTION, 0x3))`  
*The total size of the convolution matrix in bytes. Read-only [R01565]. Use a `vx_size` parameter [R01566].*

## 3.105 The pyramid object attributes.

### 3.105.1 Detailed Description

The pyramid object attributes.

#### Macros

- `#define VX_PYRAMID_FORMAT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PYRAMID, 0x4))`  
*The [Image Type Constants](#) format of the image. Read-only [R01575]. Use a [vx\\_df\\_image](#) parameter [R01576].*
- `#define VX_PYRAMID_HEIGHT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PYRAMID, 0x3))`  
*The height of the 0th image in pixels. Read-only [R01573]. Use a [vx\\_uint32](#) parameter [R01574].*
- `#define VX_PYRAMID_LEVELS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PYRAMID, 0x0))`  
*The number of levels of the pyramid. Read-only [R01567]. Use a [vx\\_size](#) parameter [R01568].*
- `#define VX_PYRAMID_SCALE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PYRAMID, 0x1))`  
*The scale factor between each level of the pyramid. Read-only [R01569]. Use a [vx\\_float32](#) parameter [R01570].*
- `#define VX_PYRAMID_WIDTH (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_PYRAMID, 0x2))`  
*The width of the 0th image in pixels. Read-only [R01571]. Use a [vx\\_uint32](#) parameter [R01572].*

## 3.106 The remap object attributes.

### 3.106.1 Detailed Description

The remap object attributes.

#### Macros

- `#define VX_REMAP_DESTINATION_HEIGHT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REMAP, 0x3))`  
*The destination height [R01583]. Read-only [R01584]. Use a `vx_uint32` parameter.*
- `#define VX_REMAP_DESTINATION_WIDTH (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REMAP, 0x2))`  
*The destination width [R01581]. Read-only [R01582]. Use a `vx_uint32` parameter.*
- `#define VX_REMAP_SOURCE_HEIGHT (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REMAP, 0x1))`  
*The source height [R01579]. Read-only [R01580]. Use a `vx_uint32` parameter.*
- `#define VX_REMAP_SOURCE_WIDTH (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_REMAP, 0x0))`  
*The source width [R01577]. Read-only [R01578]. Use a `vx_uint32` parameter.*

## 3.107 The array object attributes.

### 3.107.1 Detailed Description

The array object attributes.

#### Macros

- `#define VX_ARRAY_CAPACITY (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_ARRAY, 0x2))`  
*The maximal number of items that the Array can hold [R01589]. Read-only [R01590]. Use a `vx_size` parameter.*
- `#define VX_ARRAY_ITEMSIZE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_ARRAY, 0x3))`  
*Queries an array item size [R01591]. Read-only [R01592]. Use a `vx_size` parameter.*
- `#define VX_ARRAY_ITEMTYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_ARRAY, 0x0))`  
*The type of the Array items [R01585]. Read-only [R01586]. Use a `vx_enum` parameter.*
- `#define VX_ARRAY_NUMITEMS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_ARRAY, 0x1))`  
*The number of items in the Array [R01587]. Read-only [R01588]. Use a `vx_size` parameter.*

## 3.108 The ObjectArray object attributes.

### 3.108.1 Detailed Description

The ObjectArray object attributes.

#### Macros

- `#define VX_OBJECT_ARRAY_ITEMTYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_OBJECT_ARRAY, 0x0))`  
*The type of the ObjectArray items [R01593]. Read-only [R01594]. Use a `vx_enum` parameter.*
- `#define VX_OBJECT_ARRAY_NUMITEMS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_OBJECT_ARRAY, 0x1))`  
*The number of items in the ObjectArray [R01595]. Read-only [R01596]. Use a `vx_size` parameter.*

## 3.109 The meta valid rectangle attributes.

### 3.109.1 Detailed Description

The meta valid rectangle attributes.

#### Macros

- `#define VX_VALID_RECT_CALLBACK (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_META_↵  
FORMAT, 0x1))`

*Valid rectangle callback during output parameter validation [R01597]. Write-only [R01598].*

## 3.110 Constants for image channels

### 3.110.1 Detailed Description

The channel enumerations for channel extractions.

See also

[vxChannelExtractNode](#)  
[VX\\_KERNEL\\_CHANNEL\\_EXTRACT](#)

### Macros

- `#define VX_CHANNEL_0 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x0))`  
*Used by formats with unknown channel types.*
- `#define VX_CHANNEL_1 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x1))`  
*Used by formats with unknown channel types.*
- `#define VX_CHANNEL_2 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x2))`  
*Used by formats with unknown channel types.*
- `#define VX_CHANNEL_3 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x3))`  
*Used by formats with unknown channel types.*
- `#define VX_CHANNEL_A (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x13))`  
*Use to extract the ALPHA channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_B (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x12))`  
*Use to extract the BLUE channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_G (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x11))`  
*Use to extract the GREEN channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_R (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x10))`  
*Use to extract the RED channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_U (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x15))`  
*Use to extract the Cb/U channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_V (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x16))`  
*Use to extract the Cr/V/Value channel, no matter the byte or packing order.*
- `#define VX_CHANNEL_Y (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_CHANNEL, 0x14))`  
*Use to extract the LUMA channel, no matter the byte or packing order.*

## 3.111 Memory import type constants.

### 3.111.1 Detailed Description

An enumeration of memory import types.

#### Macros

- `#define VX_MEMORY_TYPE_HOST (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_MEMORY_TYPE, 0x1))`  
*The default memory type to import from the Host.*
- `#define VX_MEMORY_TYPE_NONE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_MEMORY_TYPE, 0x0))`  
*For memory allocated through OpenVX, this is the import type.*

## 3.112 Interpolation Constants

### 3.112.1 Detailed Description

The image reconstruction filters supported by image resampling operations.

The edge of a pixel is interpreted as being aligned to the edge of the image. The value for an output pixel is evaluated at the center of that pixel.

This means, for example, that an even enlargement of a factor of two in nearest-neighbor interpolation will replicate every source pixel into a 2x2 quad in the destination, and that an even shrink by a factor of two in bilinear interpolation will create each destination pixel by average a 2x2 quad of source pixels.

Samples that cross the boundary of the source image have values determined by the border mode - see [The border mode list.](#) and `VX_NODE_BORDER`.

See also

`vxScaleImageNode`  
`VX_KERNEL_SCALE_IMAGE`  
`vxWarpAffineNode`  
`VX_KERNEL_WARP_AFFINE`  
`vxWarpPerspectiveNode`  
`VX_KERNEL_WARP_PERSPECTIVE`

### Macros

- `#define VX_INTERPOLATION_AREA (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_INTERPOLATION, 0x2))`  
*Output values are determined by averaging the source pixels whose areas fall under the area of the destination pixel, projected onto the source image.*
- `#define VX_INTERPOLATION_BILINEAR (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_INTERPOLATION, 0x1))`  
*Output values are defined by bilinear interpolation between the pixels whose centers are closest to the sample position, weighted linearly by the distance of the sample from the pixel centers.*
- `#define VX_INTERPOLATION_NEAREST_NEIGHBOR (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_INTERPOLATION, 0x0))`  
*Output values are defined to match the source pixel whose center is nearest to the sample position.*

## 3.113 Non-linear filter functions

### 3.113.1 Detailed Description

An enumeration of non-linear filter functions.

#### Macros

- `#define VX_NONLINEAR_FILTER_MAX (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_NONLINEAR, 0x2))`  
*Nonlinear Dilate.*
- `#define VX_NONLINEAR_FILTER_MEDIAN (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_NONLINEAR, 0x0))`  
*Nonlinear median filter.*
- `#define VX_NONLINEAR_FILTER_MIN (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_NONLINEAR, 0x1))`  
*Nonlinear Erode.*

## 3.114 Matrix patterns

### 3.114.1 Detailed Description

An enumeration of matrix patterns. See [vxCreateMatrixFromPattern](#)

#### Macros

- `#define VX_PATTERN_BOX (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PATTERN, 0x0))`  
*Box pattern matrix.*
- `#define VX_PATTERN_CROSS (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PATTERN, 0x1))`  
*Cross pattern matrix.*
- `#define VX_PATTERN_DISK (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PATTERN, 0x2))`  
*A square matrix (rows = columns = size)*
- `#define VX_PATTERN_OTHER (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PATTERN, 0x3))`  
*Matrix with any pattern other than above.*

## 3.115 Image Color Space Constants

### 3.115.1 Detailed Description

The image color space list used by the `VX_IMAGE_SPACE` attribute of a `vx_image`.

#### Macros

- `#define VX_COLOR_SPACE_BT601_525 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_SPACE, 0x1))`  
*Use to indicate that the BT.601 coefficients and SMPTE C primaries are used for conversions.*
- `#define VX_COLOR_SPACE_BT601_625 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_SPACE, 0x2))`  
*Use to indicate that the BT.601 coefficients and BTU primaries are used for conversions.*
- `#define VX_COLOR_SPACE_BT709 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_SPACE, 0x3))`  
*Use to indicate that the BT.709 coefficients are used for conversions.*
- `#define VX_COLOR_SPACE_DEFAULT VX_COLOR_SPACE_BT709`  
*All images in VX are by default BT.709.*
- `#define VX_COLOR_SPACE_NONE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_SPACE, 0x0))`  
*Use to indicate that no color space is used.*

## 3.116 Image Channel Range Constants

### 3.116.1 Detailed Description

The image channel range list used by the `VX_IMAGE_RANGE` attribute of a `vx_image`.

#### Macros

- `#define VX_CHANNEL_RANGE_FULL (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_RANGE, 0x0))`  
*Full range of the unit of the channel.*
- `#define VX_CHANNEL_RANGE_RESTRICTED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_COLOR_RANGE, 0x1))`  
*Restricted range of the unit of the channel based on the space given.*

## 3.117 The parameter state type constants.

### 3.117.1 Detailed Description

#### Macros

- `#define VX_PARAMETER_STATE_OPTIONAL (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PARAMETER_STATE, 0x1))`  
*The parameter may be unspecified. The kernel takes care not to deference optional parameters until it is certain they are valid.*
- `#define VX_PARAMETER_STATE_REQUIRED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_PARAMETER_STATE, 0x0))`  
*Default. The parameter must be supplied. If not set, during Verify, an error is returned.*

## 3.118 The border mode list.

### 3.118.1 Detailed Description

#### Macros

- `#define VX_BORDER_CONSTANT (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_BORDER, 0x1))`  
*For nodes that support this behavior, a constant value is filled-in when accessing out-of-bounds pixels.*
- `#define VX_BORDER_REPLICATE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_BORDER, 0x2))`  
*For nodes that support this behavior, a replication of the nearest edge pixels value is given for out-of-bounds pixels.*
- `#define VX_BORDER_UNDEFINED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_BORDER, 0x0))`  
*No defined border mode behavior is given.*

## 3.119 The unsupported border mode policy list.

### 3.119.1 Detailed Description

#### Macros

- `#define VX_BORDER_POLICY_DEFAULT_TO_UNDEFINED (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_BORDER_POLICY, 0x0))`  
*Use `VX_BORDER_UNDEFINED` instead of unsupported border modes.*
- `#define VX_BORDER_POLICY_RETURN_ERROR (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_BORDER_POLICY, 0x1))`  
*Return `VX_ERROR_NOT_SUPPORTED` for unsupported border modes.*

## 3.120 The termination criteria list.

### 3.120.1 Detailed Description

See also

[Optical Flow Pyramid \(LK\)](#)

### Macros

- `#define VX_TERM_CRITERIA_BOTH (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TERM_CRITERIA, 0x2))`  
*Indicates that both an iterations and eplison method are employed. Whichever one matches first causes the termination.*
- `#define VX_TERM_CRITERIA_EPSILON (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TERM_CRITERIA, 0x1))`  
*Indicates a termination after matching against the value of eplison provided to the function.*
- `#define VX_TERM_CRITERIA_ITERATIONS (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_TERM_CRITERIA, 0x0))`  
*Indicates a termination after a set number of iterations.*

## 3.121 Normalization type constants.

### 3.121.1 Detailed Description

See also

[Canny Edge Detector](#)

### Macros

- `#define VX_NORM_L1 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_NORM_TYPE, 0x0))`  
*The L1 normalization.*
- `#define VX_NORM_L2 (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_NORM_TYPE, 0x1))`  
*The L2 normalization.*

## 3.122 Delay Attribute Constants

### 3.122.1 Detailed Description

The delay attribute list.

#### Macros

- `#define VX_DELAY_SLOTS (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DELAY, 0x1))`  
*The number of items in the delay [R01602]. Read-only [R01603]. Use a `vx_size` parameter [R01604].*
- `#define VX_DELAY_TYPE (VX_ATTRIBUTE_ENUM(VX_ID_KHRONOS, VX_TYPE_DELAY, 0x0))`  
*The type of objects in the delay [R01599]. Read-only [R01600]. Use a `vx_enum` parameter [R01601].*

## 3.123 The memory accessor hint flags.

### 3.123.1 Detailed Description

The memory accessor hint flags. These enumeration values are used to indicate desired *system* behavior, not the **User** intent. For example: these can be interpreted as hints to the system about cache operations or marshalling operations.

#### Macros

- `#define VX_READ_AND_WRITE (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ACCESSOR, 0x3))`  
*The memory shall be treated by the system as if it were readable and writeable.*
- `#define VX_READ_ONLY (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ACCESSOR, 0x1))`  
*The memory shall be treated by the system as if it were read-only. If the User writes to this memory, the results are implementation defined.*
- `#define VX_WRITE_ONLY (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ACCESSOR, 0x2))`  
*The memory shall be treated by the system as if it were write-only. If the User reads from this memory, the results are implementation defined.*

## 3.124 The Round Policy Enumeration.

### 3.124.1 Detailed Description

The Round Policy Enumeration.

#### Macros

- `#define VX_ROUND_POLICY_TO_NEAREST_EVEN (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ROUND_POLICY, 0x2))`  
*When scaling, this rounds to nearest even output value.*
- `#define VX_ROUND_POLICY_TO_ZERO (VX_ENUM(VX_ID_KHRONOS, VX_ENUM_ROUND_POLICY, 0x1))`  
*When scaling, this truncates the least significant values that are lost in operations.*

## 3.125 The Map/Unmap flag

### 3.125.1 Detailed Description

The Map/Unmap operation enumeration.

#### Macros

- `#define VX_NOGAP_X 1`  
*No Gap.*

## 3.126 The list of available libraries

### 3.126.1 Detailed Description

The standard list of available libraries [*R00400*].

#### Macros

- #define [VX\\_LIBRARY\\_KHR\\_BASE](#) 0x0  
*The base set of kernels as defined by Khronos.*

## 3.127 The list of available kernels

### 3.127.1 Detailed Description

The standard list of available vision kernels.

Each kernel listed here can be used with the `vxGetKernelByEnum` call. When programming the parameters, use

- `VX_INPUT` for [in]
- `VX_OUTPUT` for [out]
- `VX_BIDIRECTIONAL` for [in,out]

When programming the parameters, use

- `VX_TYPE_IMAGE` for a `vx_image` in the size field of `vxGetParameterByIndex` or `vxSetParameterByIndex` \*
- `VX_TYPE_ARRAY` for a `vx_array` in the size field of `vxGetParameterByIndex` or `vxSetParameterByIndex` \*
- or other appropriate types in [The VX\\_TYPE Constants](#).

### Macros

- `#define VX_KERNEL_ABSDIFF (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xB))`  
*The Absolute Difference Kernel enum [R00411].*
- `#define VX_KERNEL_ACCUMULATE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x16))`  
*The accumulation kernel enum [R00421].*
- `#define VX_KERNEL_ACCUMULATE_SQUARE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x18))`  
*The squared accumulation kernel enum [R00423].*
- `#define VX_KERNEL_ACCUMULATE_WEIGHTED (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x17))`  
*The weighed accumulation kernel enum [R00422].*
- `#define VX_KERNEL_ADD (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x21))`  
*The Addition Kernel enum [R00432].*
- `#define VX_KERNEL_AND (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1C))`  
*The Bitwise And Kernel enum [R00427].*
- `#define VX_KERNEL_BOX_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x12))`  
*The box filter kernel enum [R00418].*
- `#define VX_KERNEL_CANNY_EDGE_DETECTOR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1B))`  
*The Canny Edge Detector enum [R00426].*
- `#define VX_KERNEL_CHANNEL_COMBINE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x3))`  
*The Generic Channel Combine Kernel enum [R00403].*
- `#define VX_KERNEL_CHANNEL_EXTRACT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2))`  
*The Generic Channel Extraction Kernel enum [R00402].*
- `#define VX_KERNEL_COLOR_CONVERT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1))`  
*The Color Space conversion kernel enum [R00401].*

- `#define VX_KERNEL_CONVERTDEPTH (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_↵  
BASE, 0x1A))`  
The bit-depth conversion kernel enum [R00425].
- `#define VX_KERNEL_CUSTOM_CONVOLUTION (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRAR_↵  
Y_KHR_BASE, 0x14))`  
The custom convolution kernel enum [R00419].
- `#define VX_KERNEL_DILATE_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xF))`  
The dilate kernel enum [R00415].
- `#define VX_KERNEL_EQUALIZE_HISTOGRAM (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_↵  
_KHR_BASE, 0xA))`  
The Histogram Equalization Kernel enum [R00410].
- `#define VX_KERNEL_ERODE_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x10))`  
The erode kernel enum [R00416].
- `#define VX_KERNEL_FAST_CORNERS (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_↵  
BASE, 0x26))`  
The FAST Corners Kernel enum [R00437].
- `#define VX_KERNEL_GAUSSIAN_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_B_↵  
ASE, 0x13))`  
The gaussian filter kernel.
- `#define VX_KERNEL_GAUSSIAN_PYRAMID (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_K_↵  
HR_BASE, 0x15))`  
The gaussian image pyramid kernel enum [R00420].
- `#define VX_KERNEL_HALFSCALE_GAUSSIAN (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_↵  
_KHR_BASE, 0x29))`  
The Half Scale Gaussian Kernel enum [R00440].
- `#define VX_KERNEL_HARRIS_CORNERS (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KH_↵  
R_BASE, 0x25))`  
The Harris Corners Kernel enum [R00436].
- `#define VX_KERNEL_HISTOGRAM (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x9))`  
The Histogram Kernel enum [R00409].
- `#define VX_KERNEL_INTEGRAL_IMAGE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_↵  
_BASE, 0xE))`  
The Integral Image Kernel enum [R00414].
- `#define VX_KERNEL_LAPLACIAN_PYRAMID (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_↵  
KHR_BASE, 0x2A))`  
The Laplacian Image Pyramid Kernel enum [R00441].
- `#define VX_KERNEL_LAPLACIAN_RECONSTRUCT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIB_↵  
RARY_KHR_BASE, 0x2B))`  
The Laplacian Pyramid Reconstruct Kernel enum [R00442].
- `#define VX_KERNEL_MAGNITUDE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x5))`  
The Magnitude Kernel enum [R00405].
- `#define VX_KERNEL_MEAN_STDDEV (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_B_↵  
ASE, 0xC))`  
The Mean and Standard Deviation Kernel enum [R00412].
- `#define VX_KERNEL_MEDIAN_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x11))`  
The median image filter enum [R00417].
- `#define VX_KERNEL_MINMAXLOC (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x19))`

- The min and max location kernel enum [R00424].*

  - `#define VX_KERNEL_MULTIPLY (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x20))`

*The Pixelwise Multiplication Kernel enum [R00431].*

  - `#define VX_KERNEL_NON_LINEAR_FILTER (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2C))`

*The Non Linear Filter Kernel enum [R00443].*

  - `#define VX_KERNEL_NOT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1F))`

*The Bitwise Not Kernel enum [R00430].*

  - `#define VX_KERNEL_OPTICAL_FLOW_PYR_LK (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x27))`

*The Optical Flow Pyramid (LK) Kernel enum [R00438].*

  - `#define VX_KERNEL_OR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1D))`

*The Bitwise Inclusive Or Kernel enum [R00428].*

  - `#define VX_KERNEL_PHASE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x6))`

*The Phase Kernel enum [R00406].*

  - `#define VX_KERNEL_REMAP (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x28))`

*The Remap Kernel enum [R00439].*

  - `#define VX_KERNEL_SCALE_IMAGE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x7))`

*The Scale Image Kernel enum [R00407].*

  - `#define VX_KERNEL_SOBEL_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x4))`

*The Sobel 3x3 Filter Kernel enum [R00404].*

  - `#define VX_KERNEL_SUBTRACT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x22))`

*The Subtraction Kernel enum [R00433].*

  - `#define VX_KERNEL_TABLE_LOOKUP (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x8))`

*The Table Lookup kernel enum [R00408].*

  - `#define VX_KERNEL_THRESHOLD (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xD))`

*The Threshold Kernel enum [R00413].*

  - `#define VX_KERNEL_WARP_AFFINE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x23))`

*The Warp Affine Kernel enum [R00434].*

  - `#define VX_KERNEL_WARP_PERSPECTIVE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x24))`

*The Warp Perspective Kernel enum [R00435].*

  - `#define VX_KERNEL_XOR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1E))`

*The Bitwise Exclusive Or Kernel enum [R00429].*

### 3.127.2 Macro Definition Documentation

#### VX\_KERNEL\_COLOR\_CONVERT

```
#define VX_KERNEL_COLOR_CONVERT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1))
```

The Color Space conversion kernel enum [R00401].

The conversions are based on the [Image Type Constants](#) code in the images.

See also

[Color Convert](#)

Definition at line 75 of file [vx\\_kernels.h](#).

### VX\_KERNEL\_CHANNEL\_EXTRACT

```
#define VX_KERNEL_CHANNEL_EXTRACT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2))
```

The Generic Channel Extraction Kernel enum [R00402].

This kernel can remove individual color channels from an interleaved or semi-planar, planar, sub-sampled planar image. A client could extract a red channel from an interleaved RGB image or do a Luma extract from a YUV format.

See also

[Channel Extract](#)

Definition at line 85 of file [vx\\_kernels.h](#).

### VX\_KERNEL\_CHANNEL\_COMBINE

```
#define VX_KERNEL_CHANNEL_COMBINE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x3))
```

The Generic Channel Combine Kernel enum [R00403].

This kernel combine multiple individual planes into a single multiplanar image of the type specified in the output image.

See also

[Channel Combine](#)

Definition at line 93 of file [vx\\_kernels.h](#).

### VX\_KERNEL\_SOBEL\_3x3

```
#define VX_KERNEL_SOBEL_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x4))
```

The Sobel 3x3 Filter Kernel enum [R00404].

See also

[Sobel 3x3](#)

Definition at line 98 of file [vx\\_kernels.h](#).

### VX\_KERNEL\_MAGNITUDE

```
#define VX_KERNEL_MAGNITUDE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x5))
```

The Magnitude Kernel enum [R00405].

This kernel produces a magnitude plane from two input gradients.

See also

[Magnitude](#)

Definition at line 105 of file [vx\\_kernels.h](#).

## VX\_KERNEL\_PHASE

```
#define VX_KERNEL_PHASE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x6))
```

The Phase Kernel enum [R00406].

This kernel produces a phase plane from two input gradients.

See also

[Phase](#)

Definition at line 112 of file [vx\\_kernels.h](#).

## VX\_KERNEL\_SCALE\_IMAGE

```
#define VX_KERNEL_SCALE_IMAGE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x7))
```

The Scale Image Kernel enum [R00407].

This kernel provides resizing of an input image to an output image. The scaling factor is determined but the relative sizes of the input and output.

See also

[Scale Image](#)

Definition at line 121 of file [vx\\_kernels.h](#).

## VX\_KERNEL\_TABLE\_LOOKUP

```
#define VX_KERNEL_TABLE_LOOKUP (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x8))
```

The Table Lookup kernel enum [R00408].

See also

[TableLookup](#)

Definition at line 126 of file [vx\\_kernels.h](#).

## VX\_KERNEL\_HISTOGRAM

```
#define VX_KERNEL_HISTOGRAM (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x9))
```

The Histogram Kernel enum [R00409].

See also

[Histogram](#)

Definition at line 131 of file [vx\\_kernels.h](#).

## VX\_KERNEL\_EQUALIZE\_HISTOGRAM

```
#define VX_KERNEL_EQUALIZE_HISTOGRAM (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xA))
```

The Histogram Equalization Kernel enum [R00410].

See also

[Equalize Histogram](#)

Definition at line 136 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ABSDIFF**

```
#define VX_KERNEL_ABSDIFF (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xB))
```

The Absolute Difference Kernel enum [R00411].

See also

[Absolute Difference](#)

Definition at line 141 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_MEAN\_STDDEV**

```
#define VX_KERNEL_MEAN_STDDEV (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xC))
```

The Mean and Standard Deviation Kernel enum [R00412].

See also

[Mean and Standard Deviation](#)

Definition at line 146 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_THRESHOLD**

```
#define VX_KERNEL_THRESHOLD (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xD))
```

The Threshold Kernel enum [R00413].

See also

[Thresholding](#)

Definition at line 151 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_INTEGRAL\_IMAGE**

```
#define VX_KERNEL_INTEGRAL_IMAGE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xE))
```

The Integral Image Kernel enum [R00414].

See also

[Integral Image](#)

Definition at line 156 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_DILATE\_3x3**

```
#define VX_KERNEL_DILATE_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0xF))
```

The dilate kernel enum [R00415].

See also

[Dilate Image](#)

Definition at line 161 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ERODE\_3x3**

```
#define VX_KERNEL_ERODE_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x10))
```

The erode kernel enum [R00416].

See also

[Erode Image](#)

Definition at line 166 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_MEDIAN\_3x3**

```
#define VX_KERNEL_MEDIAN_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x11))
```

The median image filter enum [R00417].

See also

[Median Filter](#)

Definition at line 171 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_BOX\_3x3**

```
#define VX_KERNEL_BOX_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x12))
```

The box filter kernel enum [R00418].

See also

[Box Filter](#)

Definition at line 176 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_GAUSSIAN\_3x3**

```
#define VX_KERNEL_GAUSSIAN_3x3 (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x13))
```

The gaussian filter kernel.

See also

[Gaussian Filter](#)

Definition at line 181 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_CUSTOM\_CONVOLUTION**

```
#define VX_KERNEL_CUSTOM_CONVOLUTION (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x14))
```

The custom convolution kernel enum [R00419].

See also

[Custom Convolution](#)

Definition at line 186 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_GAUSSIAN\_PYRAMID**

```
#define VX_KERNEL_GAUSSIAN_PYRAMID (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x15))
```

The gaussian image pyramid kernel enum [R00420].

See also

[Gaussian Image Pyramid](#)

Definition at line 191 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ACCUMULATE**

```
#define VX_KERNEL_ACCUMULATE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x16))
```

The accumulation kernel enum [R00421].

See also

[Accumulate](#)

Definition at line 196 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ACCUMULATE\_WEIGHTED**

```
#define VX_KERNEL_ACCUMULATE_WEIGHTED (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x17))
```

The weighed accumulation kernel enum [R00422].

See also

[Accumulate Weighted](#)

Definition at line 201 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ACCUMULATE\_SQUARE**

```
#define VX_KERNEL_ACCUMULATE_SQUARE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x18))
```

The squared accumulation kernel enum [R00423].

See also

[Accumulate Squared](#)

Definition at line 206 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_MINMAXLOC**

```
#define VX_KERNEL_MINMAXLOC (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x19))
```

The min and max location kernel enum [R00424].

See also

[Min, Max Location](#)

Definition at line 211 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_CONVERTDEPTH**

```
#define VX_KERNEL_CONVERTDEPTH (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1A))
```

The bit-depth conversion kernel enum [R00425].

See also

[Convert Bit depth](#)

Definition at line 216 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_CANNY\_EDGE\_DETECTOR**

```
#define VX_KERNEL_CANNY_EDGE_DETECTOR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1B))
```

The Canny Edge Detector enum [R00426].

See also

[Canny Edge Detector](#)

Definition at line 221 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_AND**

```
#define VX_KERNEL_AND (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1C))
```

The Bitwise And Kernel enum [R00427].

See also

[Bitwise AND](#)

Definition at line 226 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_OR**

```
#define VX_KERNEL_OR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1D))
```

The Bitwise Inclusive Or Kernel enum [R00428].

See also

[Bitwise INCLUSIVE OR](#)

Definition at line 231 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_XOR**

```
#define VX_KERNEL_XOR (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1E))
```

The Bitwise Exclusive Or Kernel enum [R00429].

See also

[Bitwise EXCLUSIVE OR](#)

Definition at line 236 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_NOT**

```
#define VX_KERNEL_NOT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x1F))
```

The Bitwise Not Kernel enum [R00430].

See also

[Bitwise NOT](#)

Definition at line 241 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_MULTIPLY**

```
#define VX_KERNEL_MULTIPLY (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x20))
```

The Pixelwise Multiplication Kernel enum [R00431].

See also

[Pixel-wise Multiplication](#)

Definition at line 246 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_ADD**

```
#define VX_KERNEL_ADD (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x21))
```

The Addition Kernel enum [R00432].

See also

[Arithmetic Addition](#)

Definition at line 251 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_SUBTRACT**

```
#define VX_KERNEL_SUBTRACT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x22))
```

The Subtraction Kernel enum [R00433].

See also

[Arithmetic Subtraction](#)

Definition at line 256 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_WARP\_AFFINE**

```
#define VX_KERNEL_WARP_AFFINE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x23))
```

The Warp Affine Kernel enum [R00434].

See also

[Warp Affine](#)

Definition at line 261 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_WARP\_PERSPECTIVE**

```
#define VX_KERNEL_WARP_PERSPECTIVE (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x24))
```

The Warp Perspective Kernel enum [*R00435*].

See also

[Warp Perspective](#)

Definition at line 266 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_HARRIS\_CORNERS**

```
#define VX_KERNEL_HARRIS_CORNERS (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x25))
```

The Harris Corners Kernel enum [*R00436*].

See also

[Harris Corners](#)

Definition at line 271 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_FAST\_CORNERS**

```
#define VX_KERNEL_FAST_CORNERS (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x26))
```

The FAST Corners Kernel enum [*R00437*].

See also

[Fast Corners](#)

Definition at line 276 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_OPTICAL\_FLOW\_PYR\_LK**

```
#define VX_KERNEL_OPTICAL_FLOW_PYR_LK (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x27))
```

The Optical Flow Pyramid (LK) Kernel enum [*R00438*].

See also

[Optical Flow Pyramid \(LK\)](#)

Definition at line 281 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_REMAP**

```
#define VX_KERNEL_REMAP (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x28))
```

The Remap Kernel enum [*R00439*].

See also

[Remap](#)

Definition at line 286 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_HALFSCALE\_GAUSSIAN**

```
#define VX_KERNEL_HALFSCALE_GAUSSIAN (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x29))
```

The Half Scale Gaussian Kernel enum [*R00440*].

See also

[Scale Image](#)

Definition at line 291 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_LAPLACIAN\_PYRAMID**

```
#define VX_KERNEL_LAPLACIAN_PYRAMID (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2A))
```

The Laplacian Image Pyramid Kernel enum [*R00441*].

See also

[Laplacian Image Pyramid](#)

Definition at line 298 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_LAPLACIAN\_RECONSTRUCT**

```
#define VX_KERNEL_LAPLACIAN_RECONSTRUCT (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2B))
```

The Laplacian Pyramid Reconstruct Kernel enum [*R00442*].

See also

[Laplacian Image Pyramid](#)

Definition at line 303 of file [vx\\_kernels.h](#).

**VX\_KERNEL\_NON\_LINEAR\_FILTER**

```
#define VX_KERNEL_NON_LINEAR_FILTER (VX_ENUM_KERNEL(VX_ID_KHRONOS, VX_LIBRARY_KHR_BASE, 0x2C))
```

The Non Linear Filter Kernel enum [*R00443*].

See also

[Non Linear Filter](#)

Definition at line 308 of file [vx\\_kernels.h](#).

## 3.128 The Vendor ID list for OpenVX.

### 3.128.1 Detailed Description

The Vendor ID of the Implementation. As new vendors submit their implementations, this enumeration will grow.

#### Macros

- `#define VX_ID_AMD 0x00D`  
*Advanced Micro Devices.*
- `#define VX_ID_ARM 0x004`  
*ARM Ltd.*
- `#define VX_ID_AXIS 0x009`  
*Axis Communications.*
- `#define VX_ID_BDTI 0x005`  
*Berkley Design Technology, Inc.*
- `#define VX_ID_BROADCOM 0x00E`  
*Broadcom Corporation.*
- `#define VX_ID_CADENCE 0x019`  
*Cadence.*
- `#define VX_ID_CEVA 0x013`  
*CEVA DSP.*
- `#define VX_ID_DEFAULT VX_ID_MAX`  
*For use by all Kernel authors until they can obtain an assigned ID.*
- `#define VX_ID_FREESCALE 0x00C`  
*Freescale Semiconductor.*
- `#define VX_ID_HUAWEI 0x01A`  
*Huawei.*
- `#define VX_ID_IMAGINATION 0x015`  
*Imagination Technologies.*
- `#define VX_ID_INTEL 0x00F`  
*Intel Corporation.*
- `#define VX_ID_ITSEEZ 0x014`  
*Itseez, Inc.*
- `#define VX_ID_KHRONOS 0x000`  
*The Khronos Group.*
- `#define VX_ID_MARVELL 0x010`  
*Marvell Technology Group Ltd.*
- `#define VX_ID_MAX 0xFF`  
*The maximum kernel ID.*
- `#define VX_ID_MEDIATEK 0x011`  
*MediaTek, Inc.*
- `#define VX_ID_MOVIDIUS 0x00A`  
*Movidius Ltd.*
- `#define VX_ID_NVIDIA 0x003`  
*NVIDIA Corporation.*
- `#define VX_ID_NXP 0x016`  
*NXP Semiconductors.*
- `#define VX_ID_QUALCOMM 0x002`  
*Qualcomm, Inc.*
- `#define VX_ID_RENESAS 0x006`  
*Renesas Electronics.*

- #define `VX_ID_SAMSUNG` 0x00B  
*Samsung Electronics.*
- #define `VX_ID_ST` 0x012  
*STMicroelectronics.*
- #define `VX_ID_SYNOPSYS` 0x018  
*Synopsys.*
- #define `VX_ID_TI` 0x001  
*Texas Instruments, Inc.*
- #define `VX_ID_USER` 0xFFE  
*For use by vxAllocateUserKernelId and vxAllocateUserKernelLibraryId.*
- #define `VX_ID_VIDEANTIS` 0x017  
*Videantis.*
- #define `VX_ID_VIVANTE` 0x007  
*Vivante Corporation.*
- #define `VX_ID_XILINX` 0x008  
*Xilinx Inc.*
